141. [propnet] Friday's 10m ax.25 catch @ W1BW in Maine

From: Bruce Walker <bruce@w1bw.org>
Date: Sat, 06 Oct 2001 01:51:30 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40489-2001.10.05-21.17.31--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here's my 10m ax.25 report for the day. Was receive-only until about
1700Z, when I fixed my station ground problem. This was my first
attempt using AGWPE. I wasn't present during open band conditions to
listen by ear whether there was activity I wasn't decoding.

See you Saturday on psk31. --bruce W1BW

2001-October-05 23:42 3 stations

Callsign	Type	Latitude	Longitude	Km	Bearing	Last Heard
W1BW*	Grid Squ.	[FN45UB]		0.0	0	Oct 05

> socket, UI-View thinks it actually coming form a digi?

That is exactly correct.  The asterisk is an indication that the
reception was relayed, not necessarily digipeated.  Since PSK31srv
"fools" UI-View into thinking the data is coming from the Internet, it
flags it as "relayed", or not a direct reception.

Ok, what the heck is a MUF map? what does that (MUF) mean. I'm very ignorant about
this stuff.

Maximum Usable Frequency. You can use this as an aid in
DX'ing. If the MUF is at, say, 22 MHZ over a certain path, then 20 meters
should be usable to cover that path.

Rendered body type: text/plain

Hi all,
as the week-end is now here, i have some time to send you my various ideas
and feelings concerning BeacoNet.

As mentionned by Ramon (W1/PA3EUG) in boston, wouldn't it be better of
everybody to use UTC in all our messages and reports; I must agree that for
me in Europe it's quite annoying to convert each time not in UTC in order to
understand in fact "at what time exactly does it occured...". I know that
for you in USA you are accustomed to your naming conventions, but as time
goes by, I think (and hope) that additional stations will join us on this
wonderful project.

By the way, I've got a contact with a friend of mine, TR8KPJ (JI square -
Gabon/Africa) and we have started to discuss the opportunity to put a TR
station on the air, him or another one in his neightborhood, on 10 or 6m.
I will keep you informed.

A simple question: Ev (W2EV) or another station reading this mail, do we
have a full list of stations active in Beaconet; I wonder if VE stations are
on the air.

Can somebody ship me a copy of QST issue where BeacoNet have been presented
for the first time? so I can probably write (and "evangelize") an article in
French in order to promote the system. If possible here are my data:

Jean-philippe AUMAITRE
10 rue de la chapelle
Kaltweiler
57480 MONTENACH
FRANCE

This one is for W2EV; I've quite finished translating your current website
to french and I wonder if that could be published for the french speaking
community. Currently it's still a draft, focusing on the content, but will
be fine tune in the coming days; wait for you Ev on the way you would like
to handle this issue.

73 de Jean-philippe, F5SMZ

YES! This is vital to our work. The data means nothing if it cannot be
correlated to UTC. As a matter of fact, inaccurate data is worse than
no data. :o)

GMT Offset - the time offset of your PC clock from GMT. If you are east
of Greenwich, then the offset will usually be positive. If you are west
of Greenwich, then it will usually be negative. This is used by UI-View
to work out the correct GMT time for time stamps.

JP,
This is some of the best news we've heard in a while (along with PP
joining us, that is)! His participation on 10 meters would be great!
We've been searching for Africa for some time now. It will be
interesting to have him with us, if he decides to. Next, we've got to
find someone in the Pacific/Asia/Alaska.

Any thoughts as to how we could go about finding interest in the Pacific
rim, Asia, Indochina, Australia areas? Are there list serves or on-line
ham communities that cater to those areas of the world?

Ev,

Yes:
I somehow programmed my long/lat into UI-Path. That made it back into my
UIView settings, don't ask me how. UI-Path is rather buggy and I prefer not
to run it, but I have no clue on how to disable it starting every time I
reboot UI-View.

If your UIView transmits your LOCATOR and has a notion of your long/lat, it
will benchmark some stations against one, and some stations against the
other. That's why you see the 2.3 km difference between each.
I'm looking into it, I know it's ennoying... In the mean time, if there is
anybody that has a ready-to-go solution, I'd be happy to hear about it.

Thanks a lot,

Interestingly enough, Jesse (N2VRJ) has been keeping track of all of the
stations reporting activity on BEACONet. Sadly, we haven't had any VE
activity reported yet. Jesse...maybe you could copy (as text) your
information and post it to the list?

> Can somebody ship me a copy of QST issue where BeacoNet have
> been presented for the first time? so I can probably write
> (and "evangelize") an article in French in order to promote

I may have it in .PDF format. Can you accept it that way if I can find
it?

> This one is for W2EV; I've quite finished translating your

I would be happy to publish the French version. Thank you for making
the effort. You may want to wait just a little while longer,
though...I'm in the middle of redesigning the website, to help focus
things more, and to update it with information that we have learned in

the last half-year of experimenting.

Thank you for your interests and your efforts for BEACONet! It is good
to have you participating!

Your post is from UI-Mailer (see below). Does a standard UI-View
snapshot show the same thing or is this a problem with only UI-Mailer?
Would you mind posting an example, if it appears in UI-View snapshots,
too?

Ev

Hi, Ev,

Double entries appear to correlate with two different KM results
given for a specific grid statement.

Of course, could be effect and not cause.

73,

Ed

Right now I see only 1 entry for each station (with CRC check enabled, of
course...). This is my preliminary conclusion:
- I restart UIView at midnight. UIPath comes up after restart. This
influences UIView to consider my long/lat instead of my locator.
- In the morning, when I wake up and check my station, I kill UIPath.
- All station that I hear before AND after the UIPath kill, will be shown
double.

Result: I need to get rid of my long/lat settings in UIPath.

We should probably consult our UIPath expert. Wasn't Rich doing a lot with
this program?

I don't see this field in the station setup window. UIView 1.65.

169. [propnet] [Fwd: [ui-view] A new DX record!]

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 06 Oct 2001 11:28:53 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>

Cc: BEACONet/PropNET eMail Remailer <propnet@lists.tapr.org>
Message-ID: <LYR1548-40554-2001.10.06-10.56.03--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Below is a message that I recently sent to several "APRS" eMail
remailers. I'm sending this to these two lists because there is a plan
to begin experiments on 2-meters, starting in 2002.

The experiments that we've been running have been on 28.131 MHz using
PSK31 modulation and software called UI-View. The idea is to establish
a network of home-based automated propagation monitors. The work on
10-meters has been a proof-of-concept (you wouldn't believe the number
of people who used to write to me to tell me that this would never
work). It is now time to begin thinking about setting up on 2-meters,
with an eye on the Brenden Trophies.

Each transmission takes the following form:
C4LL>BSNPAH-#:[GR##ID]

It is explained below. The idea is to transmit this 24/7/365 knowing
that others are listening. When the band opens, the transmission is
received, it is decoded and an icon is placed on a map...at a location
corresponding to the grid! This system really works (proof below)!

This note is designed simply to pique interest. More information can be
had at http://go.to/BEACONet. However...imagine both sides of the
Atlantic having a dozen or so BEACONet^31 stations scattered along the
coasts, just waiting for the first transAtlantic terrestrial signals on
2-meters (144.288 USB PSK31).

Join us on 10-meters to get a good idea of how the system works, then
get ready for a QSY to 2-meters during 2002!

171. [propnet] Getting Reports from Odd Locations

From: esack <esack@pacbell.net>
Date: Sat, 06 Oct 2001 08:42:10 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40556-2001.10.06-11.03.33--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi, Ev,

We established some time ago that an inexpensive
hand held tape recorder (such as one might use
to take the minutes of meetings) easily records
and reproduces AX25 (audio) signals with accuracy
sufficient to be then reported on BEACONet
screens.

There is the phase issue to consider but I would not
be surprised if the same were true of PSK31
(audio) signals.

Where I am going with this is that when some of us
travel but cannot drag along a computer and a
transceiver, at least we could carry with us a
portable receiver such as the Icom IC-RA10 and
a small tape recorder and tape 28.131mh audio
at various times of the day when the band is
open to wherever we are.

Then, upon returning, we could put that audio into
the computer and put on the net those reports
as "Catches" from whatever location and
date/UTC time we note in our "travel logs."

I'll try it out here as soon as the band stops being
so darn exciting!

73,

Ed

Hi, Ev,

I saw an answer from Ramon.

Believe me, I am not trying to be critical of
anyone.   Just "did the deed" myself!   Was
waiting for my receiver to lock up on a
tantilizingly weak streak and "boom" my
own transmission started and the streak was
gone before I could turn the transmission off.

Just adding to the thinking that is always
going on on the net.

73,

Ed

Just took a look at the map and I see quite a few stations today. One of
interest is N8QLT at digi path of K9ER,W2EV,HOP2. AS K9ER is in the south
of Texas, I normally do not have direct propagation with that station here
in 10 meters. I just now saw K9ER pop up on the screen.

As I was looking at the MHEARD list for AGWPE I discovered a packet from
LU3AVO-2 yesterday at 2233Z. I only see one pass for that station, but for
some reason it did not display on the map nor did I get an entry in the
snapshot file. This is interesting as I assumed that if the signal was
decoded by the Packet Engine, then it should have been passed to UIVIEW.
Anyone got and explanation for this one.

Yes, 'AVO wasn't using any [GR##ID] in his transmissions yesterday for
some reason.  Therefore, he was "heard", but there was nothing to plot.
I got the same thing here...a message from him, but no plot on the
screen.  When I examined the terminal window, I saw no [GR##ID].

Nono... this is not about critizing anyone... we're not on the APRS SIG list
;-)

But it would be good to think about a possible solution for this problem. I
suggested time slotting earlier, but I am now thinking that that too is
counter productive: if all stations from the same region transmit at the
same time, the complete region is "bunched". Maybe making sure that we're
all on different frequencies is better for now, since at least then we are
not creating a real "collision". Any ideas?

I discovered the problem with the duplicate entries in the mail body and
have corrected that problem. Version 1.7 is now available on the website.

W1BW is pounding in here, S3, very strong and clear signal.
N2VRJ, and KC5DUI are also doing well here.

Rendered body type: text/plain

I was just checking if MAPI would work. It doesn't, since Outlook Express
doesnt engage my autodialer if I send an email through MAPI. SMTP works just
fine...

I will do some more experiments and let you know.

190. [propnet] Disable UIPath

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sat, 6 Oct 2001 13:08:38 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40602-2001.10.06-15.33.52--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For those of you who would like to disable UI-Path from starting up when
UI-View starts, do the following

Find a file called uipath.xtr. Should be located in the default UIView
folder.

Delete the puppy and UIPath will no longer try to run whenever UIView is
started.

You could also uninstall uipath.

Hi Ramon,
I believe Outlook Express is an smtp only client and is not MAPI aware. I think you need MS Outlook which can do both smtp and MAPI.

Complementary info:
W3NRG was received between 17:00 and 20:00 only partially.
W1BW was today the strongest signal received in N/E France.

Africa stations:
I've contacted friends in TR8 and 6W6 and they will discussed the
possibility to set-up a station in their area (24/24). That will be GREAT. I
keep you informed.

Hi all,
since 10 minutes, no more "sound" from USA.
It's 11PM local time, night has fallen since 3 hours and some thunder can be
heard all around; time to go to bed. For you, in the middle of the afternoon
I hope the band will still buzz for the rest of the day. See you tomorrow.

        There IS such a setting in the GPS Setup window, but apparently
it's only used to set the computer clock from a GPS, not to change anything
on the time stamping.

Rendered body type: text/plain

>From Roger (the author of UI-View)...
Ev, W2EV

- -
UI-View32 uses the PC system time, which is UTC, no configuration for
GMT offset is needed.

BUT - I think something is being misunderstood. Both versions show local
(PC) time in the station list, but time stamp beacons in UTC.

With either program, if users want to show UTC in the station list, then
they should set their PC time to UTC, and, with UI-View32, set GMT in
Control Panel, Date/Time.

208. [propnet] Africa could come in a near future on Beaconet

From: "J-Philippe F5SMZ" <f5smz@wanadoo.fr>
Date: Sun, 7 Oct 2001 12:00:47 +0200
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40680-2001.10.07-05.24.43--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,
I've contacted our friends in TR Gabon Republic) at 08:00 UTC today. As
mentionned yesterday I've explained the project Beaconet to us and they have
since today started to study the opportunity to join us in several ways.

First, they have received my own beacon on 28.131 PSK all the morning long
and that's an encouraging clue; at the same time I was receiveing on 28.120
PSK VK4VHD with S5! We made only a short QSO (approx 16000 kms!) ... when
our friends in VK will join us the project?

Secondly, my friends Pierre TR8KPJ and Alain TR8CA are most of time active
on 6m and they're wondering if there is enough US activity on Beaconet/6m
they could perhaps be active with you on 6m.

So, wait and see, Ev (and the rest of the group) as you can see "bargaining"
with our friends in Africa is ongoing, and be sure I do the best as I can to
persuade them to join us.

Last thing, F8BNN called me this morning and he told me that from now (as
soon as his problem with AGWPE will be solved) he will be active most of
time on 28.128 AFSK 1200 with some sporadic vacations on 28.131 PSK31, as
you aware that he can't be a permanent station for Beaconet; that's still a
good news, so from now we can transmit from JN39 in 2 modes.

Tnx for reading myself,
73 de JP, F5SMZ

        Sorry, Ev, it won't happen here, as I have too many other things
going on that require local time. This email, for instance. I'm writing
at 0511 MOUNTAIN time, if it said 1111, it would confuse the daylights out
of non-technical people I know.

210. [propnet] Today 07/10/01 - transmission AX25 on 28.128

From: f8bnn_sur_free <f8bnn@free.fr>
Date: Sun, 07 Oct 2001 14:02:19 +0200
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40683-2001.10.07-07.25.15--lyris.propnet#tapr.org@lists.tapr.org>

Rendered body type: text/plain

Hi All
Last evening, I transmit on 28.128 in AX25
I look on the message that several of you have copied my trames
This afternoon, I go out my qra for my work, I come back near 17h z..
Actually , I transmit in AX25 on 28.128.
every 8 minutes. I would like someone gives on the discussion group his
reception near 17 z
I have a problèm of reception.I decode very well on 300 bauds with
AGWPE 2001-38 but nothing on 1200 bauds. If someone can help me. I think
that is a problem of parameter but witch one.

Rendered body type: text/plain

Europe is pounding in here, but nothing from here in the U.S. I'm
hearing ON9CAQ, but he has his beacon out of order. It won't plot
in UIView. I emailed him direct to let him know.
ON9CAQ>JO20CL:HY0E02 ron1@brutele.be^C764

212. [propnet] A "Tweak" List? [was: UTC and UI-View]

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sun, 07 Oct 2001 08:40:08 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40686-2001.10.07-08.07.16--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

| | From Roger (the author of UI-View)...
| | <SNIP>
| | With either program, if users want to show UTC in the
| | station list, then they should set their PC time to UTC,
| | and, with UI-View32, set GMT in Control Panel, Date/Time.

| Sorry, Ev, it won't happen here, as I have too many other things
| going on that require local time.

I have similar issues here, but decided to post the note to the general
list to see if I was the only one (I guess not). Within the context of
being used in the APRS service, I suppose this isn't a big deal...but
for BEACONet, it's quite an issue indeed.

This got me to thinking in more broad terms. Is it time for us (as a
group) to assemble a list of features, functions and/or program
personalities that we would like to see in UI-View (or any other
software for that matters)?

By (potentially) speaking with "one voice" we could help to focus
ourselves a bit, too.

Example:
I prefer to present needs as "interests" rather than "positions". For
instance, meteor mode came about as a result of an early discussion with
Roger about an interest that we had to be able to repetatively transmit
short frames of information over long periods of time. I didn't define
how that would be accomplished, just that the need existed (an
"interest"). He came up with the brilliant implementation that we now
use. I could have said "just like APRSdos" (a "position"), but

didn't...and it's a good thing; because UI-View's Meteor Mode is much
more flexible than it otherwise could have been.

Of course, you don't always get exactly what you may want...but it's
usually because you forget to mention another interest prior to the
solution being worked on and implemented. ;-) In this case, I'd have
preferred that the feature be called something other than "Meteor Mode"
(Flood Mode, Monsoon Mode or a couple of others I can't remember right
now), as it can be used for other things than meteor chasing...but I'll
live with it. :o))

Anyway, what say? Is the time right to start thinking about such
things? I wouldn't mind assembling a list, then asking clarifying
questions and starting discussion as to each one's need, relative to the
others on the list.

Please...don't start sending your thoughts on features-of-interest
yet...I'm simply asking if there is an interest in the *excersize*. I
don't want to go through it if there isn't enough interest (***from
lurkers, too***).

Ev, W2EV

Rendered body type: text/plain

Outlook express is infact MAPI aware. All of Microsoft's email clients have
been MAPI aware for some time. MAPI works great with my version of Outlook
Express.

219. [propnet] Mobile Reception Recording

From: esack <esack@pacbell.net>
Date: Sun, 07 Oct 2001 12:29:16 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40724-2001.10.07-14.50.39--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Yesterday I mentioned the idea of carrying a hand
held receiver such as the IC-RA10 and a hand held
audio tape recorder on trips out of the country
(probably best in International Waters) to see if
BEACONet PSK31 signals could be recorded

at locations other than our current fixed station
positions. As example, one might be interested
in doing this on a trip to Hawaii or the waters
of the Sea of Cortez.

I tried recording some of this morning's PSK31
reception here by just placing a small hand held
audio tape recorder next to the transceiver
(with speaker audio on) and can confirm that
the playback through the recording input
of the computer can be detected and
shown in terms of station calls, locators
and configs on the PSK31 screen.

There is some reduction in the accuracy of the capture,
probably due to the fact that I was using the mic input on
the recorder rather than a direct wired audio
link (my recorder has a 1/8" jack output but
not a 1/8" jack input.).

The experiment was encouraging, however.

73,

Ed

?? UIMailer is independent from the version UIView you use, since it takes
snapshots images and processes them. Or am I missing something here?

Everybody watching TV?

No kidding? Sorry...I guess I spoke out of turn. I thought it required
UI-View/32 in order to work. Thanks for straightening me out. :o)
Ev

Although my memory may be failing...I'm thinking that KB9MKJ is a new
arrival! Welcome! (and thanks to K9ER for the post)
Ev, W2EV

ps...rich (rbx)...how come lat/lon rather than grid?

PA3EUG 11:32   20:17
N2VRJ   16:39   18:46
KC5DUI 16:52   20:03
N2JR   17:21   20:15
ON9CAQ 17:22   17:22 (Welcome aboard! plotted only one time, but
continously received with very weak signals - quite normal!)

Created with UI-View Snapshot Reader Ver 1.6 - FILE

Notes:
At time of reporting (now time to go to bed) the above mentionned US

stations still received in good conditions, but signal strenght phasing out
and noise becoming stronger).

TR8CA (JJ40QL) have "broken" me on 28.131 PSK this afternoon for tests; in
the coming days he will monitor the frequency and perhaps put a beacon
station.
Wait and see...

227. [propnet] W1BW catch Saturday & Sunday

From: Bruce Walker <bruce@w1bw.org>
Date: Mon, 08 Oct 2001 00:27:56 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40762-2001.10.07-19.57.54--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here are my weekend reports. Thanks to several for the nice signal reports. My holiday QTH conditions here in FN45: 30 watts from an ft-847 to an 80m horizontal loop strung around the trees up about 40'. I'm on the north slope of Sugarloaf mountain about 1600' MSL, which definitely helps to the northern bearings (including europe, of course) and hurts to the south (the mountain peak is about 4300' MSL on my outh side). My first attempt here, I had essentially no station ground causing rf in the audio until fixing that on Friday.

Monday, I'll only be on part of the day, as we're heading back to FN42. I guess I'll continue my alternating days and run PSK while I'm on tomorrow. By the way, I will try a side-by-side between agwpe and my kantronics tnc when I get back, but my hunch is that agwpe isn't copying nearly as well.

Very nice to see F8BNN on the ax.25 side today!

--Bruce W1BW

My catch for Saturday, 6 Oct on psk31

```
2001-October-07 00:40 7 stations

Very interesting to see that you can hear ON9CAQ at almost 200 km... this
should normally be in the dead zone, not?
Although I know from my days in the Southeast of the Netherlands ([JO30AV])
that I used to be able to work stations from Southeast England on 29.600
FM....

Any idea what happened, propagation-wise?

73s,

Hi folks,

I just wanted to make a small comment. Several people I am seeing have a
"HY1xxx" designator in their field, while transmitting in 10 mts PSK31.
Please make sure you correctly configure your station.... for PKS31 it
should be "HY0xxx" since there are no digipeating capabilities in PSK31.

Ev, maybe you could put a remark to this extend on the calculation part on
your website?

Thanks,
73s,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Morning all,

I haven't heard a station this morning but K7IP heard me. That's
interesting because I've heard several SSB voice calls on 10M this morning.

I thought I would come clean and let everyone know what I'm using for my
antenna. I'm in a restricted area so I had to get creative. I have a two
story on a pretty good hill. I have metal guttering around the whole house
so I decided to see what I could do using that for an antenna. The side I'm
connected to is around 80' in a "C" shape with the longest part facing to
the southeast. I'm using 300 ohm with one side going to the bottom of one
of the drainpipes and the other side connected to several different length
counterpoises (insulated 18 or 20 gauge wire laying on the ground). I based
the lengths of the counterpoise wires on the suggested length of ground
wires for my vertical antenna (which I don't have up). Figured that would
be a good start. I'm using a Yaesu FT-847 at 100W with a tuner. So far,
the results have been ok. I've been able to reach Ramon in Mass. I have
yet to see France though. I also haven't heard any voice 10M from Europe
even when the band was open.

I have some general questions about my setup in hopes that someone could
help me get out farther. I guess my main question is regarding a
counterpoise setup (or ground). Should the "other side" of my antenna be
multiple different (bandwidth related) lengths of bare wire buried in the
ground or insulated and above ground? Also, what minimum gauge wire should
the counterpoise be?

Let's see if I can communicate with the French guys!

Thanks!

Ben Miller

```
I am shutting down for the day.  Have a really good thunderstorm that has
just moved into the area.  During the monsoon season all we got was noise
and about 1/2 inch of rain.  Now that monsoon is over, we've had 5 times
that amount. Go figure.

Some time back we had information to the
effect that the HTX-10 had been discontinued
at Radio Shack.   Of course, it is still available
under another brand name from HRO.

Today when I was talking to my friend who is
a manager of the local store, he observed that
the HFX-10 had been taken off of the
```

"discontinued" code on his computer screen
and that he had stock and could get more
units.

Perhaps our interest in the units caused a
blip in Radio Shack's automatic inventory
system!!!

In any event, if anyone has trouble finding
a unit, let me know and I will put him in
touch with my friend. He said that he would
be happy to ship.

73,

Ed

Hello all,

I have finally put the 10-meter pieces together, although not in a
long-term-stable state. I'm hearing quite a few of you today.

What is this about a GMT offset field? In Station Setup? of UIView32? I
don't have such a field there; am I looking in the wrong place? I
certainly can't set this computer to UTC.

Please tell me again about how to get and set up the snapshot mailer.

Thanks. I'll send a catch list tonight.

Dave

Hi Dave,
We just asked that question of the author of UI-View.  His response is
below.  Welcome aboard!
Ev, W2EV

Ev,

UI-View32 uses the PC system time, which is UTC, no configuration for
GMT offset is needed.

BUT - I think something is being misunderstood. Both versions show local
(PC) time in the station list, but time stamp beacons in UTC.

With either program, if users want to show UTC in the station list, then
they should set their PC time to UTC, and, with UI-View32, set GMT in
Control Panel, Date/Time.

73 - Roger.

252. [propnet] Catch October 8, 2001

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Mon, 08 Oct 2001 20:26:46 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-40928-2001.10.08-22.52.18--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

Well, I got enough of the pieces together by about 2pm PT today, and below
is what I caught, with an R5 vertical and DX-70TH (10 watts out, if you
heard me). When the interface and other antenna arrive, I'll be using 25
watts with a system I can perhaps leave on most of the time.

I hope to get together with Ed W3NRG this Saturday at his QTH; perhaps we
will be able to iron out the existential questions of Beaconet31.

73

Dave
(PS - I receive this list via daily digest.)

Rich

Are you transmitting?  I do not see you on the map.  I do not see F8BNN
either.  I think his grid sq. is hosed.  Should be IN39EC.

Jeff N7YG

I think F8BNN is in JN, not in IN...

(I'm off the air now... until Saturday some time due to travel)

Yeah, I'm transmitting, but my 16 watts doesn't seem to be enough these
days. I've been sending queries to your station as I hear you pop in, but I
guess I'm not making it out there.

Rich

Hi all,

Please disregard the Prop Report my computer sent out at 10/9/01 17:05:04.
Somehow I seem to have confused the system and it didn't erase yesterday's
info. Rig is disconnected and shutdown since we are "expecting"
thunderstorms "some time" today and tomorrow. I left the software running
to see if I could get it to duplicate the computer lock-up I had last week.
Has been running more than three days (UIView32 exits and restarts around
0000Z each day) now without rebooting and system appears to be stable.
Guess maybe it was just a "chance" happening. Will be back on the air once
the weather clears up.

Bob - KC5DUI - EM26WE

gd evening Rich

My grid Locator is JN-39-EC Locate NE FRANCE near Germany
and the config is HYOE12-10.
I hope that you copy me next day. I transmit near 18 - 20 z
This evening I don't transmit in AX25 because many QRN
73 Rich and All

271. [propnet] Config info for TM-D700A?

From: "Robert J. Chen" <rjchen@stanford.edu>
Date: Wed, 10 Oct 2001 12:41:38 -0700 (PDT)
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41205-2001.10.10-15.07.00--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hey all,

I had to take some time off from propnet unfortunately due to some
unpleasantness with the condo management people where I live -- the result
of which I had to shuffle my antennas around and get rid of my 6m. Ah
well, I still have 2m and 440. Anyway, so I traded in my 706g/KAM98 setup
for a Kenwood TM-D700A and am in the process of setting up this radio for 147.585
beaconet (both level I, and II with UI-View). Was wondering if other
TM-D700A owners out there have any pointers or config info that they would like to
share...

Thanks,
-Robert, KG6CFZ

```

```
FYI:

Just got a email from Mike Shepherd at STK today, the sat database has been
updated to reflect PCsat, etc.

So they should be in the down-loadable database...

         I'd be interested in hearing more details of this switch.  Also,
why not run a "combination" antenna, so you could keep 6 meters going too?

With the 706g gone, I no longer have 6m ability, though I am going to get
a good dedicated HF + 6m rig sometime in the future...

283. [propnet] Re: Please standardize beacon report header text

From: Doug Reed <n0nas@amsat.org>
Date: Thu, 11 Oct 2001 08:41:36 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41298-2001.10.11-09.06.43--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I sorry to have to tell everyone but all these daily "beacons heard"
reports have very little interest to me. They have just about doubled the
amount of "spam" I receive daily. At the same time, I know they are
interesting and useful to many others on this list.

What I would like to suggest is that everyone who is posting such reports
should change to using the same header text for the messages. In this way
those of us who don't want them can easily filter them out of our incoming
email.

It looks like half the group is already using "Prop Report" as default
header text. Perhaps the three or four others posting similar reports can
change to the same header text?
Possibly it would be better to run it together as "PropReport" since that
is less likely to be used in a real message header? I'd hate to miss an
interesting message in the middle of a bunch of PropReports.....
Any progress on the automated web page that was suggested? That would be a
better solution for eliminating the daily posts altogether.

Would the group find the reports more useful if the header began with the
callsign or grid square of the station sending the report? It would be
easier than finding it in the From: field.

I'm sure my comments will generate some discussion but it is up to Ev and
the group to decide what to do. Thank you.

73, Doug Reed, N0NAS.
St Paul, MN

284. [propnet] Daily Reports

From: esack <esack@pacbell.net>
Date: Thu, 11 Oct 2001 08:14:35 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41321-2001.10.11-10.36.07--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am responding the question about posting daily reports.

While I will be happy to use any "subject" in my
daily report that the group agrees upon,
I hope that we do not discourage the practice
of filing daily "catch" reports.

Why?

I believe that these reports (and now I am referring
specifically to the 10 meter PSK31 reports)
in their entirety can, over time, be utilized
as a valuable data base.

If nothing else, they give a very nice picture of
the north/south/east and west paths that open
and close as we pass from one phase of the
10 meter cycle to the next.

I believe that I see a tendancy of the "leading edge"
ham community to move quickly from one challenge to
the next. That is great.   However, there
are also probably those of us who feel
that gathering data in one mode and in
one band over time has its merits albeit
maybe not with the thrills of chasing
satellite signals or being the first with
the "next best thing."

Them's my two cents which is probably
all that the thoughts are worth.

73,

Ed

W3NRG

We should standardize it to "common" standards, and have it start with
[REPORT] or something. You can then easily filter for [propnet] [REPORT].

Jeff, would this be something you could include, since UIMailer is fastly
becoming the prevailing tool for propnet reporting?

Thanks

Rendered body type: text/plain

Roman and all

Adding {REPORT] to the subject line will not be a problem at all and I will
add that to the next release. When I release that my be another issue.

As many have noticed, I am not on the air at the present time. I have been
plagued with a bombardment of virus activity over the past few day. I do
not know where it is coming from, but I suspect my ISP. I have a full time
connection to the internet and somehow or another someone or something is
bypassing my firewall.

Yesterday I cleaned off 5 different files that had been infected with
various different strains of the same virus. Within 2 hours, Norton
discovered 2 more and the computer was doing absolutely nothing except
booted up to the windows desktop.

So, until I can located the source and eliminated the problem, I am not
going to release anymore software, just incase it may also be infected.

I still will be checking email, but that is about it.

Jeff N7YG

301. [propnet] Today catches of WD4RBX, Better then you all know!

From: RickfordG@aol.com
Date: Sat, 13 Oct 2001 19:51:03 EDT
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41633-2001.10.13-19.18.00--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

I was hoping to see many more BEACOnet^31 reports today. Maybe a little later
they will come in. I turned my beacon power out down to 2 watts @ 10/13/01
00:01 UTC. Tonight I will turn my beacon down to 1 watt out. Monday @ 00:01 I
plan to turn it down to less then a watt. I won't be able to tell what my
power out will be because my meter does not go below 1 watt. I originally
wanted to do a blind test but after the reports that came in from France
today and the lack of other reports I could not resist telling the group what
I was doing. My beacon personality is accurate.

2 watts out says that the band was wide open to France today from EM84NM
South Carolina.

Your BEACOnet enthusiast!
Rich

WD4RBX

What a good idea Rick,
during the past day I didn't noticed something special from your signal,
now I understand why you didn't want to tell the group your "concealed"
projects concerning your power output; be sure that in the coming 48h it

will be intereresting to watch your beacons here in France.

JP,F5SMZ

Tnx for wonderful report,
plase notice that I was decoding (but only partially) your beacons since 2
hours before the system decoded a full beacon to plot you on the map. It
was an interesting day yesterday; think that WD4RBX was running 2W only ...
and he didin't tell us !!!! Hi,Hi,Hi.

Hi Jean-philippe
Thank you for the good news. I just got up took a shower and ran to check my
E-mail hoping for a report that someone heard my one watt. After reading your
report I went back to the shack to see if my rig was still running 1 watt and
sure enough it was. I did forget to chance my configuration code last night.
I corrected that problem. Rest assured that even though my code read
HY0B00-15 it should have read HY0A00-15.

Today's WX report is looking like I might have to shut down the beacon from
time to time today. Fortunately ill be home all day (Raining) to play with
BEACOnet and BEACOnet^31.

Rich

Ev , just a question ?
Why have choosed 1200 bds . With the short messages this is very
difficult to decode the station with small signal.
I received and see on the waterfal spectrum of the AGWpe 5 or 6
stations.
I decode only 2 stations - the strongest.
Perhaps on 300 bds,it is more easy to decode these stations. On 20
meters , i have no problem with 300 bds
If you want , i would like test this method,
What do you think about that ?
Best 73 Ev and all
Marc
F8BNN

Hi, Rich,

Amazing.   Next thing you know,
will be hearing you with your
transmitter shut off and the only
signal being due to the leakage
around the insulation of the
switch!!

Cool, indeed.   And, yes, I am
still copying you (at 1 Watt?)

As said before, some of us would
trade our favorite match book
collections for your QTH!!

73,

Ed

I believe I have the virus problem solved. Actually the ISP has fixed their
problem after building a fire and threating legal action. Back up on AX 25
for the time being.

I have also added the request to a previous email asking that we add
[REPORT] to the subject line. I am test that version now and if I don't
have any other problems with that I will post that as version 1.71 tomorrow.

Hello Marc,

you asked...
> Ev , just a question ?
> Why have choosed 1200 bds . With the short messages this is very
> difficult to decode the station with small signal.

Early, we had a choice of 1200 or 300 baud operation. As you say, 300
baud will decode more reliably with weaker signals than 1200 baud will.
On the other hand, 1200 baud is much less critical to tune-in than 300
baud is.

Since there would be a time in the future (as sunspots decline) when
propagation may not occur for days or weeks at a time, we decided to

focus on ease-of-tuning over ability to decode weaker signals. At least
we would be assured that, when the band opened, we'd be tuned closely
enough to be decodable once signal levels were high enough.

300 baud is much more critical when it comes to tuning.

For those interested in marginal signal-level BEACONet, we have
BEACONet^31. :o)

Good question, though!
Best Wishes,
Ev, W2EV

Rendered body type: text/plain

Hi Folks,
Although the station is active on HY-BEACONet, I've not been of late.
The long-and-short of it is that my time has been consumed caring for a
good friend, whose child has come down with an often fatal illness. My
spare energies have gone to help the family.

I'll be back in full force in a while. Until then...I'm running a
Peer-Hub on HY-BEACONet (a KPC3, configured to digipeat on HOPn-N)...and
I watch the "Daily Catch" reports with intense interest. Please keep
them coming.

Warmly,
Ev, W2EV

PS...I have found out why I got *no* success on VK-BEACONet this year
(that's 53.530 for the uninitiated). I got up on the roof to do some
antenna maintenance, only to have the coax connector come apart in my
hand, as I unscrewed it from the antenna. :o(I have counted this as
one lost summer.

```
Hi folks,

Back in town, at least for now... I switched on my station last night after a
rather nervous flight back. (I was on UA flight 1 from London to Dulles... we
had a Anthrax scare on board and the jury is still out on the results :-(
Let's see how it works out... hopefully it will be nothing.)

Anyways, here's the 4 PM (EDT) report. Latest I got, tonight at midnight
you'll get the complete thing. I'm still on 25 Watts. Tonight, me too I'll
power down to QRP to see if I still show up in tomorrow's reports. Also, I'll
download Jeff's latest UIMailer by then and include the [REPORT] in the
title.

Thanks,

--Ramon w1/pa3eug

Thanks for the report Ed.

I reconfigured my Rascal to rig plug in to accommodate my RCI 2950 I am
guessing as to my power out. I know that 500 Mw is the lowest TX power out
for the rig. Ill run more tests tomorrow to be sure but I think that is what
my power out is.

I saw JP also already heard him.... I guess your record is about to be
shattered !!
Welcome to the club, Sergej... nice to chat with you there on 10 meters
PSK31 for a moment

W3NRG... be on the alert! You may be breaking the DX record soon!

73s,

I am on the lookout, Ramon.

RV3APM is apparently
"in the open slot" between two buildings (for my
antenna) per my great circle chart so if his
signal "has legs," I should hear him.

73,

Ed

336. [propnet] UiMailer Version 1.71

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Mon, 15 Oct 2001 10:01:05 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41854-2001.10.15-12.38.25--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Version 1.71 is up on the website.  This version adds [REPORT] to the
beginning of the subject line so the subject line you seen when the email
comes in look like this:

    [propnet]{REPORT]

This will allow those who do not wish to see all the prop reports to filter
out these emails.  Also you could actually build a filter that moves all the
prop reports to a single email folder for later viewing.

Jeff Steinkamp  N7YG

337. [propnet] Re: UiMailer Version 1.71

From: KC7ZRU - Tate <kc7zru@arrl.net>
Date: Mon, 15 Oct 2001 11:26:15 -0600
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41857-2001.10.15-12.52.12--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Clarification?

Is that a mis-type? [propnet]{REPORT] that should've read [propnet][REPPORT]?

Thanks!

73

Uh, should've read [propnet][REPORT] that is... all []'s and no misspelled 'report's.

339. [propnet] Re: UiMailer Version 1.71

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Mon, 15 Oct 2001 11:13:55 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41861-2001.10.15-13.39.16--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This is what the subject line will start with:

     [propnet][REPORT]

[propnet] is a prefix that is added to all emails on this list. This is
added to the subject line of all messages passing through the listserver. I
have added [REPORT] to the beginning of the subject line of the email that
is constructed using the UiMailer program.

I am not sure where the { came from or the misspelling of the word REPORT. I
suspect maybe something with my email server or on our end. I checked the
outgoing source and it is correct.

Jeff

Notes:
Info of today is the arrival of Sergei, RV3APM in KO85RU; I hope he will
stay 24/7/365 if possible - so, he told me by email yesterday (when I
suggested him to come and listen to 28.131) before coming to 28.131 that he
will try Beaconet. Hopefully when he first transmit this morning (08:00 UTC)
I was exceptionally at my shack and can chat a little with him on PSK; after
the GREAT welcome of the group today I hope Sergei will stay with us and
enjoy this experimental project.

KF6XA in DM13 received in fragments around 17:30 UTC
W3NRG in DM12 received in fragments around 17:30 UTC
WDARBX very QRP, sorry Rick no signal from you today

347. [propnet] A little note on my report.

From: Jesse L Carroll <n2vrj@home.com>
Date: Mon, 15 Oct 2001 21:57:42 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41906-2001.10.15-21.24.20--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
The first report sent was incomplete. I took one last snapshot
and then sent it again. I heard wd4rbx in fragments, but thats
pretty good. I usually only here fragments when he's at higher
power. I seem to hear everybody other than the middle states here
in the U.S.

Jesse

354. [propnet] anything wrong with aprs.net?

From: "Ramon F. Kolb" <ramon@ieee.org>
Date: Tue, 16 Oct 2001 14:53:11 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-41997-2001.10.16-14.19.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
I have been trying to connect all day long already with APRS.NET (port 23),
but I keep being "forcefully rejected". My setup is no different from
yesterday's, when everything still worked perfectly. Anything going on
there?

(I cannot connect to any other APRS server because my corporate firewall
won't allow me to use any of those "strange" TCP port numbers that they
use...)

Thanks,
--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

OK...who's got BEACONet^31 and BEACONet linked? :o) I'm not
transmitting on 28.128 AX.25. :o(The bigger question is why it doesn't
show as digipeated. Hmmmm. :o)

Rendered body type: text/plain

Could be that K9ER listened on PSK31 for a while, then switched to AX.25
without erasing the snapshots that were already taken.

361. [propnet] [report] BEACOnet^31 Digest From Oct 1 to 15

From: RickfordG@aol.com
Date: Tue, 16 Oct 2001 19:17:25 EDT
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42036-2001.10.16-18.43.13--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

I am trying out a different format for my BEACOnet^31 reports. At this I am
unable to use Jef's fine program snapshot Reader.

Missing dates indicates either I had stormy Wx, no DX or some other problem.
My future reports will indicate what happened. Also Your milage may differ. I
have no idea why!

If you all don't want to see a long winded report like this ounce a week or a
month on the list please let my know.

Rich
WD4RBX

Not I! I noticed that the date was missing from the station list! Is it
possible it is a loft over catch from when you were on AX25?

I think this is the first time I heard Ev.  Once.

Where's all the DX?  (Too noisy here.)

```

I rounded off the times to the nearest quarter-hour. According to the stats, you heard your own station (F)irst at 0658 UTC, which I rounded to 0700. You heard your own station (L)ast at 0628 UTC, which I rounded to 0630.

Your eMail header shows a snapshot time of 23:55 UTC, which correlates well with my receive time (23:55 UTC) -- the Internet must be fast at that time of the morning :o).

Why the disparent disconnect between 0630z and 0700z? Does the chart contain data from the previous UTC day, too?

I'm just trying to understand what I'm seeing and how to interpret it fully. Your program is a great tool for us, btw!

Ev, W2EV

369. [propnet] Text-Chart of KF6XA - [REPORT] BeaconNet(PSK31) Prop report - 10/16/2001 8:50:04 PM

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 17 Oct 2001 07:07:26 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42129-2001.10.17-06.34.58--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The band as seen from KF6XA on the date noted, and based on his Snapshot-Reader file (below). btw...yes, I do the charts manually. :o)

Call	Heard 10/16/2001 First(UTC)	Last(UTC)
KF6XA	2:24:00 PM	3:44:00 AM
W3NRG	12:33:00 PM	12:33:00 PM
KC5DUI	2:25:00 PM	10:21:00 PM

N2VRJ	2:21:00 PM	9:13:00 PM
PA3EUG	2:22:00 PM	1:18:00 AM
KU5W	2:23:00 PM	4:42:00 PM
W2EV	6:33:00 PM	6:33:00 PM

o I'm not sure how to interpret (F)irst and (L)ast heard times that are the same (only one catch, or heard for the full 24-hours?).
o I'm not sure how to interpret stations that consume more than 24-hours either.

Can anyone offer any insights? Admittedly, I haven't loaded Jeff's fantastic program yet (ok...I'll get around to it soon) <grin>.
Ev, W2EV

Two comments:
1) I am in FN42, not in FN41
2) Maybe you can make these graphs as "real" graphs, put them on the web
somewhere and send us a link. It's not really readable unless your screen
default font is of the fixed-space type (mine isn't...)

```

Ev

This is real interesting!!! The time problem is the difference between UTC
and Local. As most of us are running our kornfuzers on local time it
present a problem. UI-view makes up the snapshot file using local time
although when you look at an individual plot on the map, it shows UTC.

Yes my plots will always show part of the previous days catch because of
this. The only way I know to get around this is to run the kornfuzer in UTC
time. This is not a problem with UI-VIEW, but other programs complain.

Not sure if we can get the UI-VIEW author to change his software a bit and
actually print the snapshot file in UTC and run the scheduler in UTC.

I think I have cured the UTC problem on my computer so I will change my
computer over to UTC and let you chop-up a few days worth of plots on my
file.

Might it be better to have the first and last heard print out in local time?

Jeff

373. [propnet] Groundwave Data

From: esack <esack@pacbell.net>
Date: Wed, 17 Oct 2001 09:56:17 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42175-2001.10.17-12.18.18--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We have been collecting
hour by hour data (using UI-Path) on the
receipt of KF6XA at W3NRG.   I was
not certain that there was a great deal of interest
in groundwave data but Ev has suggested that
I share the results with the group.

The distance between KF6XA and W3NRG is
101.6 km and the two stations are on an almost
perfect north/south line.   We have profiled the
route between the stations using DeLorme Topo.

W3NRG is essentially at sea level and KF6XA
is at about 1400 feet as best we can tell from the
rather gross altitude scale on the Topo profile.

If you draw a line between the two stations,
you encounter three hills that are higher than
the line of sight, one at 30 miles,
one at 38 miles from W3NRG
and one just about ten miles
short of KF6XA's QTH.

I won't publish the raw data unless someone
personally requests it because it would have
to be an attachment but the very clear pattern is:

(a) threre are few CRC confirmed hits between 7:00 A.M.
and 7:00 P.M.,

(b) there is a sharp rise in the number of
hits after 7:00 P.M. peaking at around 1:00 A.M.
and

(c) the reports then fall off from that time to 6:00 A.M. and

(d) at the peak, roughly 60% of the KF6XA transmissions
get recorded as W3NRG CRC confirmed hits.

Dave (KF6XA) and I have looked at this data and
have wondered if noise local to W3NRG is the only

major influence on the number of successful received
hits.

One wonders about that since the major
sources of local noise are ignition on an adjacent
highway and (I am guessing!) base QRM.   If
that were the only influence, then the CRC confirmed
hits should not fall off until around 5:00 A.M.when
local traffic begins to build.

We also wonder about "cooling" and "fog" in
the path.

I'll be off the air from 10-18 to 10-28 but will
continue to collect the data after that time.

Any thoughts or questions?

73,

Ed

375. [propnet] UI-mailer time/date formats

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Wed, 17 Oct 2001 10:10:58 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42180-2001.10.17-12.36.50--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

I've suggested to Jeff that the time in the header ought to be in UTC, and
if not, it should include the time zone or "-0700" designator so we can try
to keep these straight. Also, in the start/stop section, I think UTC
should be given as "1634" rather than "4:34:00 PM".

As to dates: what does everyone think? I'd prefer to see "2001-10-17"
(because it's easily sorted) or possibly "17-Oct-2001", but definitely not
mm/dd/yyyy, which is not used anywhere except the US.

Message-ID: <LYR1548-42181-2001.10.17-12.42.22--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi, George,

Continuing our dialog about coupling
a special version of your "warbler" to
a very low power SSB transmitter,
one of the very active BEACONet
members, WD4RBX has been experimenting
with flea power transmission and has
now been successful with:

(a) one watt and 7000 km+ CRC confirmed
reception and

(b) solar powered transmission which
comes in to W3NRG at 3000+ km like
gangbusters.

None of that is a surprise to you QRP
guys of course but it leads to a further
expansion of the potential for
a "warbler based" beacon.

Envision a "warbler" programmed
with the usual BEACONet message,
transmitting every, what, 4.5 minutes,
coupled to a very simple flea power
10 meter SSB transmitter and powered
by a solar cell set.

No computers, no receiver in that
setup. (Of course, the owner would
need to monitor as required.)

The only missing part of that is the
flea power 10 meter SSB transmitter
but I suspect you QRP guy have one
of those around somewhere.

What do you think?

73,

Ed

To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42188-2001.10.17-13.08.23--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Dave,

UIMailer takes the standard windows format. I changed my time format setting
in my computer (control panel) to 24-hour clock and it seems to work:

W1/PA3EUG [FN42KI] - [REPORT] BeaconNet(PSK31) Prop report - 10/16/2001
23:56:09
So there is a solution....

I agree with you on the use of UTC, and I emailed Jeff with the same request
a few days ago :-)

73s,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Rendered body type: text/plain

It is absolutely amazing what one can find when one searches through the help files. I found a routine that will actually format date and time to thing you want. So I have done a few tweaks and sent out a mid day report using this new code. The time in the subject line is UTC and is computed using the UTC offset you selected in UIMAILER. I also dropped the seconds from the time in the First Last heard list. Comments???

I also changed my computer time to 24 hr time and sent a report
back to myself as a test. It eliminates the AM PM crap. Thats
seems to make it nice to read. Good Idea Ramon. :)

Jesse

Rendered body type: text/plain

Version 1.72 has been posted on the web site. This corrects the local UTC
and AM/PM problem. This is a band-aid fix while I search of a solution to
interrogate the Windozes API and pull out the regional information set on
your com-putter.

Make sure you have the UTC offset set to the correct offset between your
local time and UTC time. For those who are setting their computers to UTC
time, there is a gotcha ya. In the regional settings there is en entry for
UTC time labeled some place in England. Do not use this as the computer
automatically corrects this by 1 hour because this place is actually 1 hour
a head of UTC. It should be labeled UTC + 1. Use the GMT entry for
Casablanca. This works correctly. That test email I sent out had
everything adjust by 1 hour.

Maybe I need to apply to Microsoft to write screwy code and get paid a
bazillion dollars so some one else can get paid peanuts to fix the code!!!!

Ed,
It would be interesting to see a graph of the data that you have, if it
can be done.

I agree that everything should be UTC. It makes comparisons very easy.
I also agree that it would be nice to show local timezone in the
report...allowing an easier analysis of the data.

Even as it is, though...Jeff's program is a very good tool!
Ev, W2EV

Hi Jeff,
Help files? You read 'em? :o) Ok...let's see...where's that F1 key?
:o) I'll take a gander myself, too. Thanks for the tip.
Ev

Hi, Ev,

I have been graphing the daily and total data
using the color bar chart facility in Microsoft Works.

The only way I could send you the graph itself would
be as an attachment in "bmp" format. File is probably
about 1.5meg which is no problem for me but
may be a problem for you unless you have DSL
or equivalent.

Otherwise, I can send you the data in chart form
and you can use the graph function in Works or
some other application to see the results.

Your call,

Ed

Neat! Please send it direct (cablemodem at home). I'd enjoy looking at
it. Maybe it's even possible to post to the BEACONet website (with your
permission, of course)?

Ev

I incidently saved this as "FILE" so it didn't get sent automatically. Nice
opportunity to tell you my station setup once more:

TRX: IC735, Byonics optical separator
PC: P200, 32 Mb RAM, W98 (1st edition)
SW: UI-View 1.64, PSK31Srv 1.08
Power: 75 Watts (I received my new power supply yesterday!)
Antenna: hussler 3-band mobile antenna on the roof (very small!)
Height: 30 meters above street, about 50 meters above sea level

Other data:
Scan range: 200 Hz, delay1: 2 s, delay2: 3 s

CRC: added, validated
squelch speed: fast
TRX AGC: fast
TRX RF Gain: S3
TRX preamp: on

```

```
Hi,

I would like to strongly request once more that everybody sending reports
starts the email with [REPORT], even if you are not using Jeff's real cool
tool (UIMailer). That makes filtering a lot easier since we don't have to
start looking for "catch", "Catch", "Report", etc.

I *really* *positively* *do* appreciate all reports and I read them all, but
I would like to keep them efficiently in a separate folder from the rest of
the Beaconet discussions. So please keep on sending them!
```

Thanks a lot, 73s,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

408. [propnet] UiMailer version 1.72

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Thu, 18 Oct 2001 22:23:03 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42333-2001.10.18-17.48.51--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just when you think you have solved a problem from a 360 degree aspect,
Murphy defines the circle at 361 degrees.

After releasing 1.72 I discovered there may be a problem with the code if
you have a strange format selected for the Windows date format.

In the control panel there is an option for Regional Settings that will
allow you to format your date and time anyway you see fit. For example: If
you would like the date to be displayed as 18-Oct-2001, you can enter the
following string in the Short Date Style: dd-MMM-yyyy. If you peter
10/18/01 then enter mm/dd/yy. Seems quite simple, at least on the surface.
What our wonderful boys and girls in Redmond forgot to tell us was this:
Although you can display a date such as 10-Oct-2001, this is not an
acceptable 'standard date format' according to the Windows API and may not
work with other Microsoft compatible programs.

Therefore, if you downloaded version 1.72 prior to 0100Z 18-Oct-2001, then
the version you have may throw an error message about date formatting. If
you received this message, then you may want to download the current version
on the web site. I did not update the version number, but the code is fixed
to eliminate this error (unless there is something else Murphy has failed
to explain!!).

This version of 1.72 will add the time to the subject line in UTC assuming
you have set the UTC offset correctly In UIMAILER.

Appears we have a few clowns from the Children's Band that have migrated to
around 28.128.5 using FM. Anyone else hearing this interference??

Rendered body type: text/plain

Rich
WD4RBX
The annual Orionid meteor shower peaks this weekend on October 21st.

However, one thing is certain: "Orionid meteoroids are old."

And fast. "These meteoroids strike Earth's atmosphere traveling 66 km/s or
148,000 mph," he continued. Only the November Leonids (72 km/s) are faster.
Such meteors often leave glowing "trains" (incandescent bits of debris in the
wake of the meteor) that last for several seconds to minutes.

Jeff,
Please send along the configuration code that you received for F8BNN and
you are in the record books for HY-BEACONet (beating the W2 to LU path
of 8,823km set earlier this year).

Here's a "premiminary" congrats!

Ev, W2EV

```
I will be travelling again (Paris and Copenhagen) starting Tuesday 10/23,
returning Saturday 10/27. My station will be off the air for this period.

Activity is *great* I am still hoping the 10000 km barrier will be broken
soon...

Other things we need to do: get stations from South America, Africa (JP?),
Asia, and Australia/Nw Zealand/south Pacific to participate with us in
BEACONet^31. Anyone some good leads to stations that may want to join us?

73s,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

428. [propnet] Pacific North West 53.53 submission

From: Bill Vodall <wa7nwp@yahoo.com>
Date: Fri, 19 Oct 2001 14:40:06 -0700 (PDT)
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42447-2001.10.19-17.05.57--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Folks,

My note to the coordinating committees has been submitted.

Hope this helps.

73,
Bill - WA7NWP

Summary of 53.53MHz in Pacific Northwest for BeaconNet Packet
activity.

To.
  Western Washington ARA 6 meter Repeater coordinator
  - Ed Bruette ebruette@silverlink.net
  British Columbia
  - Alan Muir. ve7beu@muircom.com
  Northern Amateur Relay Council of California
  - carlgmrc@jps.net

Hello,

While my current project load prevents my BeaconNet participation
at
this time, I find it to be potentially a very educational and
informative project worthy of recognition and support.

I believe now, before any repeaters are on the air on 53.53 MHz,
would be a good time to recognize the project and preserve the
frequency.
At the very least, any allocations on his channel could be
postponed
until all other non-conflicting channels are assigned.

Below are some notes and communications I received regarding
the BeacoNet project. A simple google or Yahoo search on "53.53"
and "repeaters" yields many additional references.

73,
Bill Vodall, WA7NWP

---

* BEACONet Web page is: http://go.to/BEACONet

  BeacoNet discussion is on a TAPR mailing list under
  the old name of "PropNet".

  http://www.tapr.org/tapr/html/sigf.html

---

* The Pacific North West has a non-standard repeater split on
  6 meters. Apparently this was done in the interest of more
  channels and to alleviate extremely difficult to filter mixing
  interference from a Seattle AM radio station operating at 1 MHz.

  The 1 MHz signal was a problem since the repeaters then on 6
Meters
  were using a 1 MHz split.

    Repeater Output + 1 MHz AM ==> Repeater Input.

  This was an ingenious solution to the problem.

---

* This is not APRS - it is similar but goals are different.
Standard
  APRS software will not, in general, work for BeaconNet.

---

* BeaconNet was presented in the May, 2001, issue of QST.

   "- BEACONet. Dust off your Packet Radio TNC and use it to
    identify band VHF openings!"

---

* 53.53 - only repeater in US and Canada is Surrey. It appears
  to still be "proposed" since 1999.

  http://www.muircom.com/6meters#53.53

My Email to Alan, VE7BFU, the 6 Meter Man for B.C.:

****

>From the Web when searching on 53.53 and repeater

  http://www.google.com/search?q=53.53+repeater

****

* Florida: "Motion by Nilo Hernandez that 53.53 MHz be released
for
  coordination to FADCA for the use of the Prop Net.
  Motioned seconded by Frank Butler. Motion passed unanimously."
  http://florida-repeaters.org/min0999.htm

****

Various communications received.

****

I just pulled a list of all co-ordinated 6m repeaters in US and
Canada from new TravelPlus CD (ARRL Repeater handbook) - They list
833
6m repeaters total (including some crossband, remote base and
simplex
repeaters). Only the one is Surrey, BC is on 53.53. 53.53 is
listed
primarily as simplex packet freq in bandplan for area South-eastern
Repeater Association co-ordinates. Texas VHF-FM society list 53.53
as
"BeacoNet APRS" so at least one group officially recognizes it. -
Bruce, KD5IUG

... also a note on repeater output/input. If area/region is using
the "standard" (whatever that means on 6m!) -1 MHz offset, the
input
would fall 5 KHz from 52.525 - not a good thing! Half a meg split
would be different ball game. - Bruce, KD5IUG

I did as complete of a study of 53.53 MHz prior to landing on it
for
BEACONet operation. I also found the VE7 repeater there, and asked
folks in the B.C., Canada area to take a listen for several days.
No
activity was heard on the frequency so, I generated a graphic that
shows the usage of the frequency. It's over 100k, but a good
gander
if you have a chance. The direct URL is:
http://www.rochesterny.org/BEACONet/images/freqav1.jpg

PropNET/BEACONet is officially coordinated in NY, Florida, Texas
and
the Maryland/DC/Va area. There may be more...there isn't a
"national
communication structure" in place by which such things are tracked
and
communicated, to my knowledge. Packet operation (though not
specifically BEACONet) is coordinated on 53.53 in the South East
Repeater Association bandplan (http://www.sera.org).

Ev, W2EV

I'll have to go digging for the notes. This map is a couple of
years
old. You can count on AA2AC (a hub in Buffalo NY) and W2AAA (a hub
in
Rochester) as full-time on 53.53. Expect a *lot* more next year.
Word
is starting to spread of the BEACONet advantage for contest
rovering...and 53.53 is the ideal frequency for that.

Ev

Ev, Jeff and group - here is snip of the Southeastern Repeater
Association 6m plan from .1 up minus calling freqs.

50.100 - 50.600   SSB & AM (500 KHz)
50.400   AM Calling Frequency
50.600 - 51.000   Experimental/Special Modes (400 KHz)
50.700 -   TTY Calling Frequency
50.800 - 50.980   Remote Control Model Radio (180 KHz)
51.100 - 52.000   FM Repeaters & Simplex, Voice &
Packet/Digital
52.000 - 54.000   FM Repeaters & Simplex Voice &
Packet/Digital

PACKET/DIGITAL FM SIMPLEX FREQUENCIES
53.490 53.510 53.530 53.550   53.570 53.590

As I am in the process of trying to clean up some of the code for efficiency, I am wondering if still need to keep the callsign checking routines. This is not really required with AX25, but with the acceptance of using the CRC check with PSK, do I really need to retain this code?

It's not unless you saved your terminal window in UI-view or your Icon is still on the screen. Double click icon and then click more info. Keep your fingers crossed.

A-ha! With that having been said...may I suggest that it not be used?
Without that information, there is nothing documenting the location of
the station posting the report.

Good point, Jeff. It sounds like that subroutine could probably be
eliminated. Of course, that is simply my opinion...but it seems that
AX.25's PASSALL OFF and PSK31srv's CRC take care of the job for us quite
nicely.

Jeff,
This is *very* cool.  Would there be a way to assure the calls appear in
the same order in each of the three sections?  I'm thinking that it may
be easier to parse by a DATArchive system, should anyone ever develop
one. :o)

Well done, once again!
Ev, W2EV

Rendered body type: text/plain

Hi,
I continue to search additional worldwide stations, but now as requested by
some of you, I'm focusing on "far" ones.
I've sent some mails to various FO-FK-FM-FY-FG-FH stations in order to let
them know the project Beaconet, clearly explained on http://go.to/beaconet.

I'm still waiting feedback from TR8CA, TRAKPJ and 6W4RK.
Wait and see...

Hi JP!
Well done. Here is wishing you much success. We already have the best
detailed coordinated propagation tracking system on 10-meters in North
America. With more world-wide participation, we could easily overtake
other coordinated systems in use everywhere. :o)

Cool message, Rich. I learned something important from it when you
said...

>
> Also copied a ping from N7YG to W2EV at 0036z.
>

Users of UI-View on BEACONet (not ^31) should invoke the command
SETUP|STATION SETUP|ADD UI-View TAG to differentiate stations that will
respond to PINGs and other UI-View specific functions from those that
won't -- such as my KPC3-only HY-BEACONet station.

454. [propnet] The Report Subject Heading

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 20 Oct 2001 09:40:34 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42588-2001.10.20-09.08.21--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

As a family of BEACONet experimenters, we adopted the phrase "Catch of
the Day" as a reminder that we "fish" for band openings, rather than
"hunt" for DX (of course...once BEACONet alerts us to an opening to a
particular part of the world...the hunt is on!). It was rather clever
(and I can't really remember who came up with it in the first place) but
have always thought it was a very nice phrase to use.

Given that the intent of [REPORT] in the subject heading was simply to
provide a more universal mechanism for automatic disposal of eMails, I
wonder if anyone would have any objection to going back to something
like [CATCH]?

I know...it's the same thing, operationally...but it really shows our
personality -- more so than [REPORT] does...but the concept is still the
same.

Rendered body type: text/plain

Tnx Ev for your encouragements,
may I suggest that if the group agree to use overlays in UI-view we could
use that system,maintain it and update it and then provide not only a list
of actives stations and also provide simply by downloading this file a
"ready-to-plot" list of participants in our respective UI-view program.

We use this system here in France to maintain and provide the more updated
list of APRS digis when new ones are installed.

Let number the overlay I just posted today, version 1.0 and then as we
included or update it could be renumbered 1.0, 1.2, etc...

Last thing, in the same philosophy (overlay = ready to plot list) wouldn't
it be better to split the actives stations on different overlays, one for
HY PSK31, one for HY AX25, one for VK AX25, etc... and then let these files
available for download on the BeacoNet website. It's up to you Ev and the
group to give me your feedback...

I don't think it makes a big difference, but we NEED TO STANDARDIZE this.
There are still many "rogue" mailers out there that slip through the cracks of
my (already elaborate) Outlook Express rule...

So let's decide on [CATCH]...

Call to arms: WOULD EVERYBODY THAT SENDS A BEACONET OR BEACONET^31 ACTIVITY
REPORT PLEASE START THEIR EMAIL WITH:
[CATCH]

Jeff, could you please update this in UIMailer?
Thanks a lot,

--Ramon

Hi JP and the group,

thanks for the overlay, it works *GREAT*

I make a few (cosmetical) changes to it and UIView that may be interesting for
others. I thought that the overlay was too intrusive on my screen, and I
wanted something that make a bigger difference between "not heard" and "heard"
stations. I did the following:

1. I edited to overlay to use the "Dot" symbol rather than the "Grid". You can
do that by globally search&replacing "GBeaconet" by "/Beaconet". in the
overlay file.
2. I played around with the overlay text, background, and border color. The
text color is now grey, and the background and border color match the
background color of my map
3. I played around with the "heard" station background color. I made this into
yellow, so you can see heard station immediately.

Just some thoughts...

I could be wrong but think you were the first to use that phrase and it stuck
. I do think that Catches is much more appropriate.

What you did (the cosmetical enhancements) was what I want to suggest in a
seconf step once you "masterize" the overlays file.

Well done!

462. [propnet] UiMailer Changes

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sat, 20 Oct 2001 16:13:52 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42600-2001.10.20-11.39.37--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just sent out a mid morning report that contains some of the changes requested. If you send a PSK report it will say BeaconNet^31 in the subject line. Any more changes/additions before I release this version. This version will also include the required additional routines to capture the configuration codes and include them with the mailer.

I've located a listserve that caters to 10-meter CW beacon operators and
propagation nuts, on all continents.  With any luck...there will be more
than a few interested in what we're doing.  Stand by... :o)

Your config code should be HY1, rather than HY0.  The "1" means that you
are capable of being a HOPn-N digipeater.  You apparently are...'cause
you did. :o)

Hi the group,
6W4RK contacted today, I've explained the Lingo of BeacoNet, the pros and
the cons...well, the minimum he need to know to be part of the network. He
said that he will consider and study the stuff and give me some feedback in
the coming days.
I hope he can join us, for sure.

I all
I had a major SNAFU today. I lost my BEACOnet software do to some kind of
window registry thingy. What's worse then that I had a new AX25 station to
report. I hope that someone else heard his/her beacon. I am willing to bet it
would have been a new AX25 record for someone. Might even be me? If memory
serves the station was in Russia. Man I was so excited to see a new AX25
station. Ya you guessed it panic struck. My butt is sore from kicking myself
for not saving the data before deleting and reinstalling.

I should have seen this coming. Saturday morning when I checked my BEACOnet
station I found that I had a sound card crash thingy. Restarting the puter
solved this problem, well I though!

The up side is that I have installed some of the latest versions of the
software we use.

Morel of the story. Error message # whatever! Duck and cover...! Or fix NOW!

Rich

Who said the band is closed? Though I must say, *I* haven't heard anyone
in a while now...

Hi Rich.

Yes you are right, I was try today AX25 on the 28128 USB, and heard you.
Distance was near 8520 km.

In the next days i again will be working in the AX25 and PSK.
UI-View32 and AGWPE with IC-718-50Watt.

Rendered body type: text/plain

Hi folks,

I was playing around in QuickBasic, and I wrote a small program that reads
and parses all the snapshots in my snapshot directory. Something like Jeff's
mailer, but now geared towards the long run It contains the following data:

 Total Stations on a day-- Total Hits on a day-- Call -- Date and then the
number of "hits" per 1-hour period. Note that I have been running my
Snapshots with 5 minute intervals (not with 1-hour intervals like Jeff's
standard file does) since the "beginning of time". So the maximum number of
hits per hour is 12 or 13 (if you are lucky...)

I turned the data in a CSV file (comma separated format) so you can easily
import it into Excel or Works or whichever Micro$oft program you like. I
also made a few graphs in Excel.

I will attach the raw data to this email, and I can send you the Excel file
that made with a few graphs (on request, too big for mailing list
distribution). Really cool stuff all, gives a pretty good quantitative view
on when the band opens.

73s

Yes, it's true, at time of report I lost PA3EUG the strongest station here
in 5mn, then in the following 15mn, NOTHING,NOTHING,NOTHING, even the LU
and PY stations on 28.120 have disapeared instantly in 5mn, and were
received S7/S9 some minutes ago!

Couldn't let this one go... see attached Word file (Word97). Some real cool
graphs extracted from the info I sent earlier. It's about 27 kbytes.

Ramon,
Fascinating data! I compared what you got on a path to 'NRG on the west
coast to what the ARRL's propagation prediction model suggests and found
them to be quite disparate. According to ARRL, the path should open at
1200Z and close at 2400Z. Your real-world data shows the path opening
at around 0900 and closing around 2000. Are your times Z?

Fascinating! BEACONet could be used to further refine known propagation
models! :o))

My times are all EDT, taken straight from the Snapshot logs.
We are 4 hours behind on Z, which means that 0900 EDT is 1200Z and 2000 EDT
is 2400Z.
So we're still in sync with the model, right?

Another small thing.... sometimes I switch off my station around 2100-2200
EDT because of TVI on my (own!) television. Need to keep the family happy
:-). Most of the time, the thing is on again around 0700 EDT, just before
the band opens. So the data around the edges may be a little skewed...

```

```
I recently downloaded ver 1.72, but there seems to be an issue
with the times. I sent these to myself , one right after the
other.
Notice the difference in the times from one report to the other.
1.71 shows my local time I submitted the report and catchs in
UTC,  but 1.72  shows a UTC submitted time and the catch times
are local even though they say UTC.

Jesse

490. [propnet] My next wish

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Sun, 21 Oct 2001 22:51:53 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42819-2001.10.22-01.22.58--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

If we don't force CRC verify in UI-View, then we get lots of imperfect callsigns in the snapshot, and then UI-Mailer reports them all. This forces me, at least, to not use automatic sending. I create a file and clean it up manually before mailing it.

If we DO force CRC verify, then of course we miss many of the weaker signals.

Interestingly, when copying W3NRG on groundwave overnight (we're 100 km apart), I get about 12 different variations on his call ... but the grid info is almost always perfect. This says something, but I don't know what. I think it has to do with how soon psk31srv locks onto his signal, which has at least 15 seconds of preamble. My computer is 166MHz; I wonder if it would lock on sooner if my processor was faster. Or if the delay1 or delay2 were set differently. Or the scan range was different.

Does anyone else have the same experience? If so, we could beg Jeff to scrutinize the grid square info too, in an attempt to tell if it represents a station with a busted call.

Anyway, here's the wish: if UI-View could be set to include all beacons received (regardless of CRC), but flag whether the CRC was valid, then UI-Mailer could optionally disregard the non-valid-CRC entries, resulting in a much cleaner automatic mailing.

Here's another item that I an starting to get excited about: I'm going to Hawaii Dec 28 - Jan 13, and I plan to take BEACONet with me. This will include a week at water level in Maui, and another in Kauai, but Jan 4-6 is likely to be from a high-rise in Waikiki. I plan to take at least a 10-meter hamstick or an Outbacker Perth antenna, but would be interested in other ideas too.

73

491. [propnet] Valid CRC factors [was: My next wish]

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Mon, 22 Oct 2001 06:50:41 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42833-2001.10.22-06.18.40--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Dave,
The groundwave experiment that you refer to running with Ed is a
fascinating one. He sent me the data, which I'll be posting to the
website in a little while, for all to see. The fact that it could be
run and observed so dramatically using BEACONet is yet another
acknowledgement that we've got a very cool system here. :o)

As for CRC's and partial receptions, I'm wondering if what is actually
being observed could be addressed in a number of different ways (and
maybe it's a combination of things):

o A clean, strong waterfall streak, yet a delayed lock-on time?
o Is the waterfall streak weak and fluxuating in strength?
o Is the quality of the streak appropriate (or is is wide, with lots
  of "side-streaks")?

These are three examples of three very different reasons for getting
only partial decodes. In order, the reasons are:

o It takes too long to lock-on, given the variables of Delay1, Delay2
  and Squelch Level (as well as channel activity level).
  - Experiment with these values over several sessions to find the
    combination that is "just right"
o Such is the nature of propagation :o)
  - It is rare that the band "pop's open" or "slams shut". We will
    always get a certain number of partial catches.
  - Even when the band is open, there are fluxuations in signal level.
o The transmitting station has set their injected audio too high.
  - Tell them. Otherwise, PSK31srv will attempt to lock on to one
    of these side-streaks, delaying lock on the real data stream.
  - We all want to be transmitting with the most clean signal
    possible. Please, folks...if someone tells you that you're
    a bit "wide", just back down on the old Mic gain a little. A
    drop from 100 watts to 80 watts isn't noticable in signal-strength
    but can really clean up a waterfall streak alot.

I guess that I'm suggesting that there are natural reasons for partial
receptions (band fluxuations). The trick is to separate them from those
over which we have control and minimizing the artificial ones.

Interestingly, Ramon recently shared a "catch-graph" with me on the path
between W3NRG (California) and him (Mass.). It correlated very highly
with the ARRL's MUF charts for 10-meters over that path (more on this in
a bit). Maybe Ramon will share W3NRG's configuration code (as received)
and his own Delay1, Delay2 and Squelch settings with the group. We can
compare Ed's TX settings to Ramon's RX settings to see where we can
further refine our own station settings a bit.

Ev, W2EV

Ev,

did you get my 4-page analysis that I sent you last night? Most of the info
you are asking for is in there. I am not sure about Ed's config code,
though.

Actually, the more I think about it, the more I find that we *should* have
the CRC checking on, and let that work as a "natural selector" for packets.
If a signal is strong enough to make it through the CRC check, it should be
OK. Right now, I think we miss around 50% of all transmitted packets due to
PSK31Srv tuning problems or due to the fact that either the reporting
station and the transmitting station transmit simultaneously or two
transmitting stations transmit simultaneously in very close range. This loss
is fine as we can normalize against it.

I will go on refining that write-up still, as this is the "interesting" part
of doing BEACONet. Having your station running a beacon is always cool, but
it gets a little boring after 6 months of continuous operation :-)

Jessie

I made a in version 1.72 to correct all them times to display UTC in the
header. I dissevered a problem with my code and had to rewrite it. Instead
of trying to re-invent the wheel, I change the report time to reflect UTC.

Jeff

Rendered body type: text/plain

Hello All,

I am getting good signals down here in the
Sea of Cortez area.   Yesterday, I recorded
a number of 28.131 mh BEACONet transmissions
during the daylight hours and hope that they
will decode properly when I get home to my
computer.

And, yes, early Sunday morning, we were tramping
on each other again.

73,

Ed

W3NRG

Rendered body type: text/plain

Hi all,
just to let you know, that the Ten has closed suddenly in 5mn; no more
signals heard in France coming from USA!
I had a look since on 28.120, still some South America stations coming here
in PSK31 but very, very weak signals.

As you will see in my report in few hours, I lost first W1/PA3EUG then
N2VRJ. I also have noticed that the "sound" of their PSK transmissions was
"strange" at the end of (local) afternoon.
Pse Ev, don't gossip on my "technical" clues :), that I try to give in
order to enhance my daily report!

>

That's why, on AX.25, I still run with PASSALL ON but clean up the stations
display before taking the snapshot. I often convey this information in a
brief note with my report such as "N7YG received from X to X," or other
notes about messages intercepted.

I think a brief narrative sent with the report, if you have the time, can
help turn some of this data into information. But, of course, mine is a
manual process and isn't as slick or convenient as the UI-Mailer facility.

500. [propnet] Updated OVERLAY for HY Band v1.1

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Mon, 22 Oct 2001 21:43:26 +0200
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42915-2001.10.22-15.13.12--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,
I have continued updating and correcting the BeacoNet Overlay file this evening. So as mentionned yesterday, I think it's a good way of maintaining up to date a list of stations running on BeacoNet, and that give us the possibility to instantly plot the list on our map!
Here is below the version 1.1. I propose to maintain this list as stations comes and go or want to have records updated; as you can see, I have now added firstname and email address.
Please notice Ev, that loading the overlay on a "beautiful" map in UI-view could be a good thing to promote the project, as it provides in a glance an overview of the worldwide members of the network.
I still had keep a single list for both AX25 and PSK31 since some of us are running both mode ... and it's quite tricky to maintain, unless some of us want the overlay to be splitted in 2, hence hyax25.pos and hypsk31.pos, it's up to the group which split (or no) they prefer.
If you want additional info to be included or modifications, feel free to contact me. Hope this help.

73 de JP, F5SMZ

501. [propnet] Hardware Problem - OT

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Mon, 22 Oct 2001 20:17:33 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-42919-2001.10.22-15.43.52--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Earlier I indicated I was having a hardware problem with the computer. I
have solved that problem. Here is a brief overview of the problem.

On Saturday evening, My XYL called me at work and indicated the computer was
making "weird noises". I asked her to describe the noise and of course it's
the same weird noise the dishwasher, vacuum cleaner and every other
mechanical item makes when something is wrong.

On Sunday morning I started the troubleshooting process and heard this noise
she was concerned about. It actually sounded like the computer was 'passing
gas'. I determined this sound was occurring exactly every 2 minutes.
Thinking this may be some new virus activity, I booted to DOS. Still had
the sound every 2 minutes. Turned the computer off to start taking it apart
when I was interrupted to do something else. When I came back to start
taking the computer apart, there was the damn sound again - NO POWER!!!

To make a long story short, the problem was traced to my pager. I had left
the pager next to the computer on a wooden shelf. The pager was set for
buzz operation. The XYL had tried to page me, on Saturday, but as the pager
was at home, I never returned her page. That is about the same time she
started hearing the weird noises. The pager is setup to re-page every 2
minutes until the pager is reset. The vibration from the pager was
resonating the wood shelf making it appear as the sound was coming from the
computer.

Oh! how I love these Kornfuzers!!!

Actually, my collegue had the same problem about a year ago when we were on
business travel in Japan. His wife had the refrigerator repairman come out,
only to find out that the pager was stuck between the fridge and the wall,
and vibrating every 2 minutes... Got to love them :-)

>4. Occultation of 8.9-mag. SAO 61166 = HIP 44087 in Cancer by (361)
>Bononia Wed. night, Oct. 24 UT, over n. Sardinia and s. Corsica (23:31
>UT), Italy with Rome at s. limit, Croatia, Hungary, Slovakia, s.e.
>Poland, w. Ukraine, s.e. Belarus at 23:32 UT, and Russia near Moscow.
>
>   IOTA/IOTA-ES occultation update for
>   (361) Bononia / SAO 61166 event on 2001 Oct 24 UT
>   Visible from Europe (Italy to Russia)
>Summary
>-------
>On the evening of 2001 Oct 24 UT, the 141 km diameter (subtends 0.062")
>asteroid (361) Bononia will occult a 8.9 mag star in the constellation
>Cancer. In the case of an occultation, the combined light of the
>asteroid and the star will drop by 5.3 mag to 14.1 mag (the magnitude of

>the asteroid) for at most 6.8 seconds. This update is based on
>UNSO/Flagstaff astrometry for the asteroid kindly provided by Ron Stone,
>historical astrometry from AstDys, and the following catalogs for the
>star position: Hipparcos.
>
>The occultation path

Yes, I got it...but I've been distracted with another project. I'll
look it over shortly. Thank you!

I agree, JP! Good idea. I will use your overlays in future
presentations that I make.

> I still had keep a single list for both AX25 and PSK31 since
> some of us are running both mode ... and it's quite tricky to

Would it be possible to show BEACONet (AX.25) as one overlay icon (dot,
maybe?) and BEACONet^31 as another icon (x, maybe?) and stations on both
as a third icon (large dot, maybe?)?

I don't know how good of an idea this is...it's just my first thoughts.
Other opinions are encouraged. :o)

Thank you for your efforts! This can help alot!
Ev, W2EV

I've sent a couple messages to the HF Beacon's listserve that I
mentioned that I found a couple of days ago.  I'll periodically include
the BEACONet list, just as an FYI.  Here's one I sent earlier this
morning.

Ev, W2EV

Rendered body type: text/plain

Ev,

I think, as far as my tuning W3NRG goes, it's problem #1.

I think a large part of the problem is noise from my monitor.  In the
absence of a big signal, I see thin lines every 130 Hz or so all across the
passband.  Psk31srv is usually fluctuating among several of these, and even
if a big signal (and I man a big, fat one like KC5DUI always presents), it
```

may look at two or three of the others before finding it.

The other variables in this setup are audio level, AGC speed, squelch
control setting on psk31srv, and presence of other noise that distracts
psk31srv.

PA3EUG  16:27       16:27

Created with UI-View Snapshot Reader Ver 1.72 -  FILE

Note:
Since I'm using this version, first and last are equals, last being the
right time. This never appeared with previous version of UI-mailer!!!
Time inside the report is im local time (I correct it manually) but the
first header line time is correct, in UTC!
So Jeff can we go back to the previous version or do you plan to release a
new one?

Today, I've received HP1BSL in FJ09GB, approx 9000 kms but enable to plot
him as his beacon was:
HP1BSL > HY0E02: [FJ09GB]  hp1bsl@hotmail.com
I hope he has received me.

And finally, an "intruder", N2TIF; no I'm kidding.

Rendered body type: text/plain

Hi Dave,
It sounds like you're a victim of a common problem...monitor QRM. :o)
Thankfully, it's one of the easiest to remedy. With all of the computer
savvy folks out there these days, it's entirely possible that you've
already tried a few of the things that I'm about to suggest...

Monitor QRM is usually a result of one of several things, including:
o Incorrect/out of date video driver
  - Download and use the latest video driver for your monitor card

```
o Use of non-optimum scan or refresh rate
  - Most monitors can be run at different scan rates.  Try them all
    until you find one that produces the minimum QRM while still
    allowing you to see a good picture.
o Use of non-optimum monitor resolution setting on video card
  - Certain screen resolutions generate harmonics from the card, for
    a number of reasons.  Try different screen resolutions until
    you find one that meets your needs and generates minimum QRM.
o Lack of ferrite core on the monitor line
  - There should be one as close as possible to the monitor card

Give it a go and see if any of this helps...and let us know how things
turned out.  It's good to have you aboard! :o))

Ev

523. [propnet] N7YG & F8BBN

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 24 Oct 2001 06:10:11 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-43253-2001.10.24-05.38.07--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Guys,
Acording to Rich (N8QLT), your configuration code is incorrect...

> Config code, via
> ----------------
> N8QLT   HY1E02-15,HOP2-2
> W2EV   HY1G03-15,N7YG*,HOP2-1
> N7YG   HY0G02-15,HOP2-2
> F8BNN   HYOE12-10

If I was digipeated by N7YG, then Jeff's config code should be HY1.
F8BBN should check to see if his config code is HY(zero) or not. At
first, it looks like the (zero) is the letter "O", which is invalid.

I'm just trying to be helpful. We may someday have a UI-View add-on
that automatically parses this information for display somewhere. It
would be good to be as accurate as possibel. :o)

Kind Regards,
Ev

The latest version of Snapshot Reader is great, Jeff! It seems to have
alot of what we need to visually inspect the previous day's catches from
any one of our participants. Well done!

I was wondering about a couple of things...
Was the K9ER omission in the last section manually removed or an "oops"?

Also...I'm still trying to get a handle on the second section. Do I
read the K9ER information as a "single reception" at the time noted, or
24-continuous hours of reception? Also...W2EV... should that
information infer 23-hours of reception starting at 23:57 one day and
ending 22:47 the next?

Ev

it was exactly the case yesterday for HP1BSL that I was receiving fine
since 3 hours without be able to plot him on map, but fully decoded. As I
have his email I send him a message in order to fine tune his beacon.

Hello, All,

We are continuing to receive what should be decodable BEACONet signals here in the Sea of Cortez. We
have pretty good recordings from everywhere but Matzalan where the ship ancors opposite some high power
transmitting stations and the QRM was enormous.

Will sure be neat if we can give reports from Puerto Vallarta and points north.

73,

Ed

W3NRG

That is a problem I am working on now. For some reason we are carrying over a snapshot prior to 0001Z. I have not figured that one out, but I am hot on the trail. As for the KE9R plot, I had just one plot on him at 23:37. I also had a plot on you at that time and they carried over. This is why I have not released this version. Hopefully, I will have this tracked down in a few days. Each time I make a change I have to run a 24 hour course to make sure I cured the problem.

Thanks for the heads up on the config code. Have made the necessary change.

Jeff

Hi Sergey,

I heard your PSK31 BEACONet signal, one time only so far, a little while ago:
24-Oct-01 1518 UTC

here in DM13. 9813 km. I copied this, I think it is not quite perfect.

RV3APM>HY0FB2-c:

Hi the group,
I received today an email from Ismail TA9J.
He told me that after browsing BeacoNet website he was really interested in
what the group is doing and he will join us in a near future. I'm eager to
plot him on my map.
I think it's a good news !!!
So guys, in NA, watch your map for breaking the DX record!!!
Currently, I don't know if he will be sporadically active or 24/7/365.

Marc,
Congratulations! Your reception of N7YG is a new record for AX.25
HY-BEACONet. Since you showed his configuration code in this note, I
will add this to the BEACONet website for all to admire! See
http://go.to/BEACONet | Information | Notable Records. You now "own"
two records!

Callsign	Type	Grid Sq	Lat / Lon	Km	Bearing
N2TIF*	Home (HF)	42.56.47N	078.48.25W	6261,9	298

Welcome aboard! To better your chances of being decoded, omit lat/lon
(leave them blank) in UI-View. Place your 6-character gridsquare
between square brackets in your Beacon Comment field like this: [FN02OW]

It's nice to have another western New Yorker on the band! I'll have to
get back on ^31 to see if we are in LOS or not.

Ev, W2EV

549. [propnet] 4 bands BeacoNet RF-BRIDGE description

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Thu, 25 Oct 2001 13:39:46 +0200
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-43478-2001.10.25-07.09.03--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PLEASE DISPLAY THIS MESSAGE in font COURRIER
Hi Ev and the group,

you will find below my experimental "BeacoNet RF-BRIDGE" I'm experimenting currently.

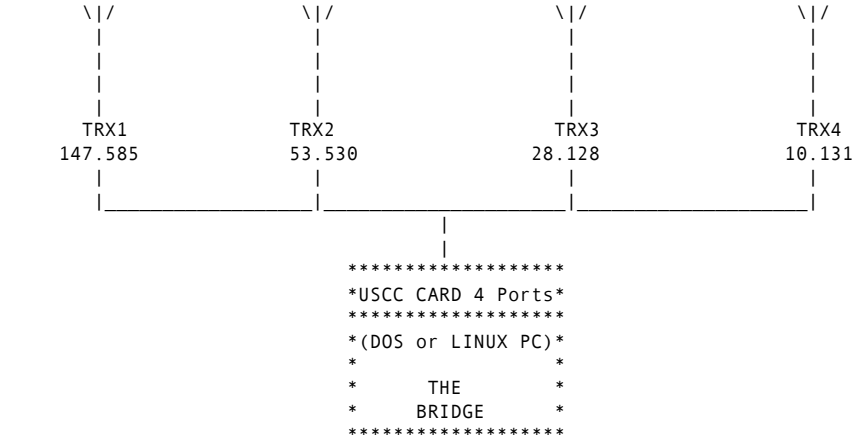
Why did I do that?
So, from the beginning I was looking for KPC TNC as stated by Ev to do some testing in AX25 for BeacoNet.
Here in Europe, it seems apparently that purchasing a Kantronics TNC is a QUEST! so I decided to bypass the
KPC requirement and try to do something, perhaps better or more customizable or more powerfull, and perhaps
cheaper than the original proposal.

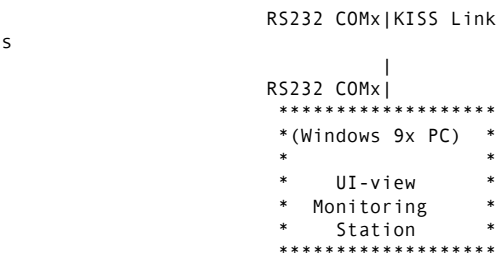
The first statement was the handling of the HOPn-N, the second one was to build a real RF-BRIDGE.

First in order to make you all understand the solution proposed, let me introduce a piece of sofware (well
known in Europe for APRS: "Digi_Ned APRS Digi Software" from my friend Henk PE1DNN running on Linux or DOS and
highly customizable, behavior of the digi is only limited to your imagination. I really know this soft since
the early beta releases and I also lead the technical support for french speaking peoples. We have now reached
version 0.31. As I'm fully involved in APRS network building here as sysop of APRS digi F5ZNJ I tried to find
a similar use for BeacoNet RF-Bridging, and I think I've found it.

Description of the 4 frequencies 1200/300 bps enable BRIDGE + wired monitoring UI-view station.

The Overview:
2 PC + 4 TRX and 1 Baycom USCC ISA or PCI internal card.





Let's assune to clarify the system that BRIDGE's callsign is BR1DGE.

Description:

THE UI-view Monitoring station - is quite normal configuration, but it's purpose here is only to monitor
and display what's going on on the 4 band where the bridge is active. Hence this station has to remain silent
and never send AX25 frames - it's a ONLY RECEIVE station.
To be able to communicate with BR1DGE we set-up in UI-view menu "Setup - Comms", select KISS with the COM port
where the cross RS232 wire is connected. That's all for now, all the stuff is done on BR1DGE. The monitoring
station is not mandatory.

The bridge, BR1DGE - here it's a little bit more complicated, but I will not go deeper in details (especially
if the group has only minor interest in my system).

First, I use a Baycom USCC 4 ports ISA or PCI card. This card is capable of handling 4 modems 1200bds, plugged
in an ISA or PCI slot. Price is with 4 modems installed (could be less if not needed) approx 330 € (EUROS).
The PC BR1DGE is running DOS 6.22 on a Pentium 90 and 16Mo of RAM. A STATE OF THE ART CONFIG!!! :)
All the TRX are connected to the USCC card with the right wire, depending of TRX used. Of course.
Don't forget to connect the 4 antennas (NO, NO I can see you smiling and starting gossiping, but the author
had forgot to connect one and spend 30mn wondering why there was no signal on the VHF band!!!)
So that's all for hardware, let's analyse the sofware Digi_Ned now.

To undestand what described below, I only mention that Digi_Ned is a rule-driven digi software, hence it does
what's is written in some config files (text) respecting a dedicated syntax. My purpose today is not to talk about the syntax but only sum up how the bridge acts currently.

I've configured BRIDGE to handle HOPn-N (quite easy, I have just write new rules).
In the initials tests, ANY frame received on ANY band is digipeated on the band it comes from AND digipeated
to the other 3 remaining band + digipeated without manipulating the path to the UI-view station. Its obvious
that this general rule could be altered, for example to "digipeat all frame from 28.128 to VHF" AND/OR
"DO NOT digipeat frame from 10.131 to 28.131", well we are free to do exactly what we want.
When digipeating of a 28.131 frame occurs then bridging to VHF, you can see on VHF the HY of the originator
of the frame.

Different beacon and TO fields can be sent on all the bands, VK* for VHF, HY* for HF, etc. Different timimg
can be applied, etc...also different beacon text. Note that only callsign BR1DGE goes on air.

Digi_ned can also handle queries like ?DX 1 and list all DX stations heard with callsign and distance on port1.
A ?DX 0 query give all DX for all ports with a timeframe I can define easily, 24,12,6,3,2,1h !!!

This demonstrate clearly that BR1DGE could also be connected to classical APRS network, allowing
us to keep informed stations in neightborhood of the digi of BeacoNet

stations heard with DX in real time;
hence, each time a DX is discovered by the digi (a threshold distance
trigger has to be define) he
automatically send a broadcast on a given band (for example the one
dedicated for APRS traffic). Note, that
bridging from APRS freq can be disable in order to prevent jamming of our
BeacoNet freqs; hence defining a
ONE WAY rule.

And EVERYTHING WORKS FINE !!!

Last thing concerning UI-view use.
Everyone use the Grid Locator ascii symbol (the one defined by APRS official
spec), and he you watch the
monitoring station's map you can't see at a glance which station comes from
which band, cause each have a
Grid square symbol. This little problem can be bypassed in a easy way. How ?
There is a image file used by
UI-view that map each ascii symbol to a small graphic; we need only to
redesig the graphic file with new
symbols and ask all BeacoNet station to use a defined ascii code for the
icon. This allow me for example, to
see a red Grid square icon for station coming from 28.128, a blue one for
53.530 and a green one for 30m.
We can also use some other synbols, like VK,HY, etc... It's just to explain
the concept.

I hope you found at least some interest reading me.
Fell free to contact me for additional info.

testing testing de AC7HA SKo12345
testing tioting de AC7=A SKFOR INFO
This stations seems to be in Arizona in DM43

KF6XA have been also received in fragments.

N2VRJ and KC5DUI: both stations are at the same distnace from me but it's 10
times harder to decode KC5DUI compared to N2VRJ; please note also that from
all the stations I can receive, you are the one with the most decodable
signal, even with very weak signal. I noticed that some stations are coming
with a brighter yellow than you but are harder to decode compared to you.
What about your system?

Strange phenomena happened today: I was receiving correctly the 2 US
stations since a long time, and suddenly between 14:00 and 16:00 UTC
everything has dissapeared, NOTHING received anymore from USA until 16:00
UTC when they came back again.

Hope this help.

I have been playing around with DDE "Dynamic Data Exchange" and I believe this is the way to interface UiView with my mailer program. For those not familiar with DDE, there is a very basic description of how UiView handles DDE and what information can be obtained in the UiView help file under technical information. UiView acts as a server and the mailer act as a client.

UiView send the string of information appearing in the monitor window directly to the client. From this string of information I can decode the following:

- Time Heard
- Call Sign
- Configuration Code
- Route

Using this information I can compute the path distance and bearing. Using the configuration code I can compute the band,mode and transmitted power.

So, How would we like to display this information in the mailer? What kind of options would you like to see in the software?

I will be releasing version 1.73 shortly, but it will not have the code to display the configuration code. I am having great difficulty capturing this info as it is not directly stored in any file. I created some batch files to do some magic, but if something gets out of sequence, everything crashes and we don't what that to happen -- someone might get the idea I work for Microsoft!!!!

Rendered body type: text/plain

Has anyone else heard S57MHA in JN76LN? I was scrolling through
the psk31srv screen and noticed his call several times. No plot
though.

Jesse

Notes:

W5MBM received most of time but enable to get a full frame :)
WB4RBX had today a bad signal, wide and strange, very difficult to decode.
TA9J in LM10MN now on my map, but need to fine tune his beacon, I've sent
him a email to correct his beacon

Wow Jesse,
2 new stations from Europe from 2 countries, S57 and TA, that's sounds good
for the group and begin to be interesting beaconetting in Europe ... I was
a little bit alone in the past weeks :)

```

```
I have updated the website with version 1.73.  Many of the changes will be
invisible to the user, but I did include changing the subject line to
include the words CATCH.  BEACONnet and BEACONnet^31 are now included in
their proper case.

I have not included the station configuration codes in this release.  I am
still having minor problems with the way I am collecting the data.  When I
```

do the version 2 rewrite I will include this feature.

588. [propnet] Snapshot Mailer 2.0 thoughts

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 27 Oct 2001 10:03:11 -0400
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-43848-2001.10.27-09.31.18--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Jeff (and the group)!
I almost sent this to Jeff privately, but decided to share with the
group with the hopes that it may engender even more thoughts about what
might be nice to include in Snapshot Mailer 2.0.

Nice job on the latest snapshot mailer, BTW. I've downloaded it and
will start using it today. Your previous note on what features to add
to v2.0 got me to thinking a bit (NOTE: I'm fishing for collaborative
commentary on these, nothing more...)

Ev, W2EV

Consider some of this...

o Sorting the list from east to west (following the sun's path)
  - a combination reverse-alpha sort as described below should do
    the job:

```
     + First character of Grid locator (rough e-w determination)
     + Fifth character of Grid locator (much finer E-W determination)
     + Final sort based on "first heard" times, in case there are
       more than one in the same 6-character square
     + "some" routine to pack those folks with lat/lon into the
       right place too (or maybe put them at the end?  I dunno).

o Add the originator's callsign and 4 of 6 gridlocator to the
  subject header
  - [CATCH-PA3EUG-FN42]...
  - See below for why...

o Trapping for "nothing heard except host station".  This would keep
  the list from being inundated with automated "nothing heard"
  reports.
  - However...maybe the trap should send a "payload free" eMail
    with a subject heading that includes [NOCATCH-C4LL-GR##]?  At
    least that way...as the band starts to suffer from lack of solar
    activity, we will know that we've still got some active stations.
    We learn as much about propagation from [NOCATCH-C4LL-GR##]
    reports as we do from [CATCH-C4LL-GR##] reports.
  - By the way...I will take the earlier suggestion of establishing
    another mailing list to manage the [CATCH-...] and [NOCATCH-...]
    traffic and think about it more deeply.  I'd like to hear some
    discussion on the pro's and con's of doing so before I tell
    you where I've already established it. :o)  We may not need it
    after talking about it...but I'm prepared just in case. :o)

o Text-charting at the end of the eMail...
  - Either similar to the ones that I manually provide from time-to
    time (rounded to the nearest 15-minutes)...

Very nice!  I've clocked back to 10-watts output (no TVI or TelephoneI
at that level).  This is f-a-s-c-i-n-a-t-i-n-g!

Folks...I just looked at my terminal screen and am noticing alot of
experimenters on our frequency...probably folks from the HF beacons list
that I've been evangelizing on lately.  For the time-being, you may wish
to *keep* including your CRC in your transmission, but *not* to a CRC
validation...you may find some interesting and rare DX to be had. :o)
```

"Wild catchs" notes:

G4FHN in IO81SL heard continuously in fragments (I noticed that Jesse N2VRJ
is doing a good job)
S57MHA, also received continuously in fragments
ON9CAQ, same report

TA9J: strong copy of him, at time of writing he is coming here S7-S9 ! I
hope that some of you in USA have copied him. I sent him several email since
3 days in order to help him be qrv. He only need to change to Grid Square
position to shorter his beacon ... would be cool to see N2VRJ DXing Ismail
at 10600kms!
Well, I've sent Ismail the link to subscribe to the email reflector.

HP1BSL heard around 16:40
"04oPSK31 Beacon de HP1BSL/— PanameaoAGO.TO"

And at last, my US DX, W2EV (coming very strong today) rarely catched by
myself on 28.131 :)

FINE BUSINESS Jesse,
I was sure that you were the best candidate for breaking the 10000kms
record.
TA9J, Ismail need also to shorter his beacon lenght with grid square to
help you.
Tomorrow will be exciting waiting for your report!

Rendered body type: text/plain

As the activity on AX25 seems to have diminished, I am up on PSK while I do
some testing on the rewrite of UiMailer. I think I have implemented the
station table similar to that available in UIPath. I did download the new
version of UIPath and it appears to play nice now. I have no way to
interconnect to UIPath as it is a DDE client to UIView.

Not sure I have everything set up correctly for PSK, if not, please advise.
I have already found some subtle differences in the way thing are output
from UiView when running AX25 and PSKServ.

While I agree that Digi-NED is a wonderful program, I'd like to point out (at Ev's urging) that you can also use UI-View to connect various bands together. In fact, I have a cross-band 2/6 meter digi here at my home, using UI-View32. Once you get UI-View "talking" to various TNC's, and you then want to digi form one band to all the others, you can simply go into the digi setup and use something similar to the following:

DIGI ROUTES
1=1,2,3,4
2=1,2,3,4
3=1,2,3,4
4=1,2,3,4

Roger will, of course, be able to shed further light on this

subject, but UI-View is a great program, with a tremendous amount of
features included.

Hey Rich

I got the station table similar to the one in UI-Path working. Had a few
false starts with the string grid I am using, but it appears to be working
now. I am going to leave this running here on the PSK freq for a few days
and make sure it does not crash.

The G and S57 got "munged" as a result of CRC being disabled. :o(
However, this really shows just how hot 10-meters has been. Very
interesting indeed! Also interesting that California and Washington are
missing. Hmmmmmm. :o)

Rendered body type: text/plain

Hi all,
this email only give you additional info, in reply to KC5XB earl.But I WANT
TO STAY IN THE GOAL OF THIS REFLECTOR.

If I proposed a solution for RF-bridging based on a cheap piece of hardware
(USCC 4 ports card, note you can go to 8 ports) with DigiNed software
intsead of using UI-view was:

1) UI-is a wondeful CLIENT program witha digipeating feature implemented at
the beginning, in order to allow APRS stations in Europe to enhance the
non-existing network you had some years ago here.

2) As a registered user of UI-view since 2 years I think quite knowing the
pro and cons of the program and trust me the digipeating feature of UI-view
is really for emergency (every digi has crashed in the neightborhood)
because you CAN'T have a kind of intelligent digipeating.

3) No BIG OS needed to make things running.

4) I'm now confortable to handle or create, rewrite ANY routing protocol
(APRS/BeacoNet) as it evolves; hence, path manipulation. For example,
depending on the Unproto address, or the path of the frame, different
routing behaviors can be defined.

5) The solution proposed was completely opened and customizable, independent
from APRS rules. In that way, you can tell the bridge to do:

ANY UI-BASED PROTOCOL HANDLING
ROUTING
CROSSBAND-ROUTING
FILTERING
BROADCASTING (here SFI/A/K index is updated/send in an automated way on a
23cm band)
PATH MANIPULATION
QUERY HANDLING
SYNCHRO TRANSMITTING
REMOTELY MANAGABLE
TELEMETRY HANDLING (here a Lightning detector is connected, and the digi is
able to broadcast the object on client-map as soon a strike is confirmed and
located by the sensors)

This week-end I've continued to dig in the BeacoNet protocol in order to
identified potential new implementations of the protocol, by creating a new
configuration.
Note that all that is mentionned above is in a SINGLE PLAIN TEXT FILE!

Well, tnx earl for opening the thread, I hoped more answer to my original
email.

73 de JP,

Rendered body type: text/plain

I agree totally with J-Philippe -- Digi-Ned is a wonderful program, and
you can do things with it that might see almost unimaginable. ESPECIALLY
the path manipulation -- adding a hop, for instance. It's great.

        On the other hand, UI-View has a digi function built in, and I've had
great success with it. Of course, you cannot customize it to the extent of
Digi-Ned, but things are still possible. For instance, my cross-band digi,
here in my shack, with do WIDEn-N, TRACEn-N, HOP1-1, RELAY, WIDE, TRACE,
and several other functions. You can't control ID versus NOID, you can't
shorten the DWAIT, there are a lot of things you can't do. But for casual
experimentation, it's just fine.

        As for "2) As a registered user of UI-view since 2 years I think quite
knowing the pro and cons of the program and trust me the digipeating

feature of UI-view
is really for emergency (every digi has crashed in the neighborhood)
because you CAN'T have a kind of intelligent digipeating."

I've not had a crash from UI-View32, and I've been doing this for a couple
of years myself.

I'd also say that perhaps this points out some of the differences in
European and American usage. Neither one is right or wrong more than the
other, they're just different.

7 3
Earl

615. [propnet] Re: Snapshot Mailer 2.0 thoughts

From: "Ramon F. Kolb" <ramon@ieee.org>
Date: Sun, 28 Oct 2001 08:05:41 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-43997-2001.10.28-07.32.46--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There is one thing on collecting statistics. If you really want to count the
Catch Per Hour, you will have to change your SCHEDULE.TXT to make a snapshot
every 1-minute or at least every 5-minute interval. 1-minute is better, and
actually it doesn't use too many extra cycles of you PC. It *does* use a
little bit more HD space, but that's something that can be resolved by
erasing the old snapshot files once in a while.

Another solution could be to use the DDE interface to "count" catches, which
is something that UIPATH uses for example.

Thanks again for the great software, Jeff...

616. [propnet] [REPORT] check you clock, change your UIMailer settings !

From: "Ramon F. Kolb" <ramon@ieee.org>
Date: Sun, 28 Oct 2001 08:12:30 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-43998-2001.10.28-07.39.40--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Folks,

in much of the world, last night Summer Time (or Daylight Saving Time in the
USA) ended. Although Windows *does* automatically change the setting,
UI-Mailer needs to be instructed that you are now "1 hour less" related to
UTC.

For the US in specific:

EST = UTC-5
CST = UTC-6
MST = UTC-7
PST = UTC-8

Did Western Europe change as well?
I know the UK is back on GMT (=UTC for all purposes), and Western Europe
would be UTC+1

Again, please make sure that UIMailer has been updated if your region
changed to Standard or Winter Time.

Thanks, 73,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Rendered body type: text/plain

Hi all

Has it become an issue or is it my imagination? BEACOnet^31 has grown by leaps and bounds this fall. This weekend in particular has been quite exciting. Toady's station list looks more like a DX log book then a study in 10 meter band opening. As some of you know I have been in the rough for about a week now. I am feeling better today. I spent a good deal of time in the shack watching PSK31svr snagging beacons. I also watched it miss a heck of a lot of them. That (I think) is the issue.

First of all (As Ev & others have mentioned) we need to spread out. Here is why. I was coping a station that I was hardly waiting to get a plot on for my records as to when the West coast would start coming in today. Well, the station started coming in and I got a solid copy to about half of his beacon when another close by beacon started TXing and I lost the info on the first station. For some reason the stations appear to be canceling each other. This happened several times and an accurate account of the West coast band opening was lost.

Second thing that started bugging me was missing good beacons. Today I have seen as many a 5 beacons on the screen at the same time. Some were to weak to decode while others were just fine. What bugged me was that the scan would lock on a weak beacon that would not completely decode while a strong one went by. I figured that I need a different set up. This is what I did.

Set the squelch. I watched the beacons decoding and the squelch. I guestimated where the squelch should be set so that only strong enough beacons will break and hold it open. Anything weaker would not decode completely.

I set Delay 1 to 3 and Delay 2 to 1.

Results Now my scanner flies and does not waste time on weak beacons or noise. I wonder what would happen if I went into PSK31svr INI file and set delay 2 to . 5? Would it help? Would it work? Remember! Miss one character of a beacon and Validate CRC will reject the beacon.

What you all think?

Rich

>

Actually, this is the avenue I am working on now. Using DDE to 'catch' the
data from Ui-View. I have the DDE link currently working now. Doing some
experimentation ad I believe I can get a station table similar to UI_path to
interface.

Rendered body type: text/plain

The Bridging and Gate-ing experiments that are gaking place are
excellent. I know that we all benefit from them...and sharing them with
the group. Thank you both sincerely, for doing so.

digi_ned is an excellent and robust product. All that I ask is that we
not introduce unexpected secondary problems by using it. For instance,
the APRS service, Destination-Address -SSID is used for RF routing, but
on the BEACONet service it is used for Antenna Pointing vector. We
wouldn't want a transmission to be processed by APRS rules.

Also...we have gone to great pains to make sure that we don't use
APRS-style path aliases. The idea is to make sure that the BEACONet
data stream isn't corrupted by meaningless (to us) APRS posit reports.

On the other hand...digi_ned is an extremely powerful and very useful
program (as JP pointed out). There is much to be gained by learning how
it can be configured for use in the BEACONet service (without
introducing . We are well positioned to take advantage of all of the
positive things that digi_ned has to provide. This is a *good* thing.
:o)

As Earl pointed out...UI-View is an excellent and versitile bridge-ing
program...and as JP said, digi_ned is a very powerful multifunction
(including bridging and gate-ing) system.

If one uses DDE, rather than KISS, does this introduce any other
problems, such as inability to be a HOPn-N digipeater in AX.25?

If one sets-up for 1-minute snapshots, is there an option to have the
snapshot file deleted at the end of the day, so as to not take up large
amounts of disk space over time?

Just asking,
Ev

Rendered body type: text/plain

Hi all,

Propagation seems to be skipping my corner of Arkansas. Saw Jesse's CATCH
and he's doing great! The only station on my map is ME!!

Have DIGIPAN running on a second computer doing a scan aroun 28.131 and not
finding a thing. Guess I'm in a hole here.

Have a good day.

Bob - KC5DUI - EM26WE

Yes, Sergey! You are absolutly correct! Upgrade to 2.38 makes the
difference. Thank you.

Vy 73!
Evhen

Hi Bob

I also noticed that. I was going to E-Mail you and have you check your
antenna was still hooked up ;-)

Hi Bob,
Somehow, Jesse's always done better than most of us. My little brother
(in-law) likes to rub my nose in it from time to time. Ok...almost
every time we talk on the phone.

Don't forget, though...there's much to be learned from [NOCATCH]
non-reports, too. It just isn't as much fun as [CATCH] reports. :o))

Lately, there's been alot of geomagnetic activity, which tends to favor
non-polar, N-S and equatorial E-W paths. I think that your lack of
receptions is indicative of that, and the fact that there are fewer
BEACONet^31 participants due north or south of your location.

Keep the faith.
Ev, W2EV

637. [propnet] Week-end feelings

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Sun, 28 Oct 2001 20:48:52 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44129-2001.10.28-14.17.04--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,

as usual for me, week-end is the right moment to take some time considering
our activity,
keeping in mind results of the past week, and trying to upgrade the current
situation.

First of all, after quite 1 month of 24/7/365 operations as F5SMZ/B on

28.131, my main
feeling is to have found exactly what I was expecting from the project, tnx
Ev and the
group.

I would like to give you today some general remarks and feelings.
I fully agree with Rich WD4RBX when he say "Toady's station list looks more
like a DX log
book then a study in 10 meter band opening". :) So I want to thanks
particularly Sergei,
RV3APM and Ismail TA9J for joining us. They have brought many new
possibiliies, especially
in Europe, 'cause something appears now on my map before 12:00 UTC each day
:)

The positive of additional participants is to widen the scope, the range,
the study and
the results known from the project. The negative one is the one mentionned
by Rich, some
stations could TX at the same time and especially on the same frequency. I
think first to
avoid this situation is to "spread out" or perhaps set up a longer TX
interval; e.g
everybody 6mn, as there is a very short probabillity that everybody launch
UI-view and so
the timer at the same time. Perhaps we must agree on dividing the frequency
range around
1500Hz for different countries or continents; or perhaps reconsider from
scatch some
rules of the system or the whole. Another possibilities is to "restrict" 1
station in one
square or portion of square, or something like that, because stations too
close from each other
don't give an added value on the intercontinental propagation study, but
"jam" 2 times
more the band (of course if transmitting on the same band!).

It is perhaps time to widen the HF tests on the 10.131 or other HF bandsby
splitting the
team across other these additional bands.

I feel that the group has started to be more focused on PSK31 (on HF) and
dropping AX25.
Am I right or is it the truth ? From my point of view I will be more
promoting PSK31 on
HF, but I would like to test VHF and up using both modes, when more european
stations will
join us. I'm still in favor for building an RF-BRIDGE/GATE as described this
week in the
email reflector.

The daily reporting system: Jeff has done a GREAT job since the initials
release of the
reporting tool concerning the format and taking in consideration the daily
feedback of
the group. Tnx Jeff. But in order to not waste the daily "jewels" (the
catchs) do you
think we need really now a storage system (a database oriented) for the huge
amount of
data the group is posting daily. I know it's not easy, but let me dream if
we could
have something looking like http://www.findu.com but especially customized
for BeacoNet.
I'm currently considering an FTP based system but Jeff's knowledge of the
core of UI-view
and various .DLL will be critical.
In the same idea, perhaps some of you have been lucky to have a look at
Ramon PA3EUG's
draft propagation study done on data of October; it's really fascinating and
interesting.
The value added is for sure in these kind of reports.

As I'm quite new in the group, I don't want to bother you but from here,
BeacoNet is now
leaving the teen age and entering the adult era; Ev, that's the succes :)

Please, notice that I'm fully dedicated to this wonderfull project and
continue searching
some "key" stations (Africa for now) to join us, as we have now a quite good

East-West axis,
and still a bad North-South axis due to the lack of stations in these areas.

At last, the "marketing" and "communication" issue: EV, in order to better
promote the
project, don't you think it could be interesting to strenghten the website,
considering
translation in 3 or 4 main languages and perhaps reposting some articles in
different
ham publications around the world? As I told you some weeks ago, I was
working on a
french translation of your website, but is now on hold, as requested by
yourself, you
are working on a new version. I'm waiting the greenlight.

When I joined, some of you said "welcome aboard", may I ask you now "what's
the heading, Sir".

appears to be an issue between the 16 bit version and the 32 bit version. I
have 1.65 of the 32 bit version and it works fine.

642. [propnet] First Report - Tapes from Cruise

From: esack <esack@pacbell.net>
Date: Sun, 28 Oct 2001 13:27:03 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44137-2001.10.28-15.49.12--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

To the group:

Some will recall that I took a hand held short wave
receiver and a hand held tape recorder with me
on a 10 day cruise down and around the bottom of the
Baja peninsula and there tuned to and recorded
28.131mh at various intervals.

I took a few minutes to sample decode some short sections of the
audio tapes I made of our BEACONet PSK31 signals
on 28.131mh, being curious as to whether I was
successful in the project or not.

The good news is that I am able to decode some calls and
grid reports. As example, Ev, I have you loud
and clear on the return leg.

An important conclusion is that next time, I need to
use a tape recorder with a line input rather than
the speaker to microphone link. There is just
too much phase distortion in the speaker to
mike link and deck noises tend to make
matters worse. As example, there is one
resonance probably due to engine speed that
"looks like" a warbler signal when of course
it is not.

The bad news is that it is going to take me a
several days to correlate my GPS log of where
we were when I heard a particular signal,
with the call letter/grid location decodes. (I have
about three hours of tape to work through.)

I will do it, however, and will report here
when I have gleaned all I can from the
tapes.

Bottom line, (and no surprise) many of
the U.S. BEACONet stations would be well received
in Mexico (at least in Baja) if we had a "lurker" set up there.

I imagine that the European signals would
be detected by a fixed station with a better
antenna (than I could "hide" on the ship) as
well.

Worth the effort, and fun, however.

73,

Ed

W3NRG

The periodic update from the BEACONet project (the 10km barrier is
broken!)...

As heard today from N2VRJ on the Gulf Coast of Florida (forwarded from
the BEACONet/PropNET listserve on TAPR), with a manual addition at the
end...
Ev, W2EV

Ok...before I get any more well meaning prods, Yes...it's a typographic
error.

The 10k km barrier has been broken from TA9J to N2VRJ.

Join us...we're having a ball on 28.131 MHz USB on BEACONet^31.

Ev, W2EV
PS...
See my (W2EV) screen (about a 225kb download) from yesterday at:
http://www.rochesterny.org/BEACONet/images/W2EV-20011027.htm

Hi guys, here is my first propnet report,the UK is now back on UTC since
morning of 28th Oct
Can anybody give me the URL for UI-View Snapshot Reader Ver 1.73 or have I
missed it on the UIVIEW or BEACONet sites
```

Regards de G4FHN Bob g4fhn@thersgb.net

Fantastiq! :o) A hope for the first African! Thank you for the early
warning, JP.

```
Have noticed a couple "mid-day" (CST) CATCH reports that show my call so
hopefully when I get home this evening I'll have something to report.
"Thought" I'd set things up so UIMailer would sent the report at about 1800Z
but probably selected "File" instead of "SMTP" - maybe one of these days
I'll get things right.

Bob - KC5DUI - EM26WE

664. [propnet] Baja Trip First Three Days

From: esack <esack@pacbell.net>
Date: Mon, 29 Oct 2001 16:18:21 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44285-2001.10.29-18.40.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello, All,

I have sent the first three days data to Ev
as an attachment. I could not get the data
to travel without major columnar distortion
otherwise.   Perhaps Ev will post it to
the BEACONet web site for all to access.

Of significance, in addition to hearing
KC5DUI, PA3EUG, WD4RBX and
N2VRJ very consistantly on the way
from San Diego to Puerto Vallarta,
Mexico, I got a solid decode on
F5SMZ while in Puerto Vallarta.

The attachment I sent to Ev has the
grid squares for my locations when I
decoded the PSK31 signals.

(If anyone wishes to receive the
data as a Works Spread Sheet
attachment, just let me know.)

73,

Ed

W3NRG

669. [propnet] Re: HY AX.25 catch, 10/29/2001

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 30 Oct 2001 05:49:15 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44353-2001.10.30-05.17.52--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

It's truly sad that AX.25 hasn't caught on the way that PSK31 has.
There are distinct advantages to packet at 1200 baud that don't exist on
PSK31.

Even so...the Leonids meteors are about to begin falling...so it's time
to shift gears a bit...get ready. :o)

Ev, W2EV

670. [propnet] Leonids Meteor Shower Approaching

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 30 Oct 2001 06:37:48 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44356-2001.10.30-06.06.07--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

AX.25 based operations will soon begin, as we fish for Leonids Meteors!
Here is where AX.25 shines! Get that TNC connected. If you don't have
a TNC, then use AGWPE to utilize your soundcard as a TNC. Instructions
for "Meteor Mode" are on the website (http://go.to/BEACONet).

"Rock Jockies" will populate 6- and 2-meters (147.585 MHz FM). Will
there be any experimentation on 223.780 FM? How about 28.128 USB? More
info shortly. In the mean time...

"The duration of the Leonids meteor shower covers the period from Nov 14
- 20. Maximum occurs on Nov 17 from a radiant of RA=153° , DECL=+22° ,
(Solar longitude=235°) . Maximum ZHR typically reaches 10-15, but most
notable are the periods of enhanced activity that occur every 33 years -
events that are directly associated with the periodic return of comet
Temple-Tuttle. "

And compare this...
http://comets.amsmeteors.org/meteors/showers/leonidprediction.html

I found this while surfing. I have no connection to the seller.
Contact them directly, if interested. -= Ev =-

Subject: FS RS HTX-10 10 meter Transceiver
   Date: Mon, 29 Oct 2001 15:14:11 GMT
   From: "Charles Hugg" <chashugg@earthlink.net>
Newsgroups: rec.radio.swap

FS a very nice Radio Shack HTX-10 Ten Meter Transceiver with original
mic,
operators manual, power cord, and mobile mounting bracket. Works great
looks
very good. Seldom used. $75 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

682. [propnet] Future Vision [was: Week-end feelings]

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 31 Oct 2001 07:01:19 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44479-2001.10.31-06.29.33--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi JP,
Your insights are right on the mark. We'd discussed much of this earlier on the list, but only with a vision of the future. We are a group of experimenters...few of which have coding or web development skills to make the vision a reality. We tend to use other people's software (PSK31 & UI-View) in ways that they never envisioned as we don't really have many developers of our own (with just a couple of exceptions). As a result, we must wait until someone gains enough interest in development before we can make progress in certain areas.

> mentionned by Rich, some stations could TX at the same time and
> especially on the same frequency. I think first to avoid this
> situation is to "spread out" or perhaps set up a longer TX
> interval;

There are multiple things that involve the problem that we are experiencing, including:

o "hidden transmitter" syndrome (you can hear me and
   Rich, but Rich and I can't hear each other...therefore
   our systems have no way to avoid collision of each other's
   transmission). To fix that, we choose a "random" TX interval
   out to 2-decimal places. That way the chances of two hidden
   (from each other) stations transmitting at the same time for
   very long is minimized.

o Everyone "thinks" they are on +1500 hz, yet natural variations
   between transceivers spreads us out around that frequency (a
   good thing). The problem of "frequency bunching" will increase
   as more and more participants join us. As an intermediate step,
   we may wish to "split the hemispheres", with Eastern landing on
   +1550 hz and Western landing on +1450 hz. That would spread-
   out operation from 1350 to 1650. We would need to change our
   scan range to a value of 150hz to be sure the entire range would
   be eventually scanned. I'm not sure there is enough traffis in
   Region 1 to suggest this strategy yet, though. Comments?
   - In the loooong view, we already have a plan of assigning a
     center-frequency for each continent...but we need more
     experimentation with the scan-width and delay1/delay2 settings

before we can be assured that the plan would work well.

> Another possibilities is to "restrict" 1 station in one
> square or portion of square, or something like that,
> because stations too close from each other don't give an
> added value on the intercontinental propagation study...

I'd hate to restrict participation. There is plenty of fun to be had by anyone willing to join us. :o) Even very close stations can help to benefit the BEACONet system. Ed (W3NRG) has demonstrated some very interesting "groundwave" data can be collected using our system. There are so many propagation questions to answer... :o)

> I feel that the group has started to be more focused on
> PSK31 (on HF) and dropping AX25. Am I right or is it the
> truth ? From my point of view I will be more promoting PSK31 on
> HF, but I would like to test VHF and up using both modes, when
> more european stations will join us.

Your perception about hams seeming to favor PSK31 seems correct. There are many advantages to AX.25...but there is much interest in PSK31 as a mode, and I think that ^31 interest carry's over into BEACONet (on HF, anyway).

I also agree that AX.25 will do well on VHF (such as meteor scatter and VHF Rover Tracking). 6-meters may benefit from both.

> The daily reporting system: Jeff has done a GREAT job...Tnx Jeff.

> think we need really now a storage system (a database oriented)
> for the huge amount of data the group is posting daily. I know
> it's not easy, but let me dream if we could have something looking
> like http://www.findu.com but especially customized for BeacoNet.

YES! :o) This concept is based on a variation of two products: an Internet-based live "reflector" similar to the APRS-services Internet system (in BEACONet, we'd call it LIVExchange Server) -and- a data archiving and display server similar to FindU.com (in BEACONet, we'd call it DATArchive Server). I've had discussions about a LIVExchange server, and have found a product that abides by BEACONet protocol specifications. I've tested is only briefly. As soon as I can save-up the $100 registration fee (I have twin boys -- 2-years old...very expensive <smile>) I will implement it (I even have a server and dedicated Internet connection to do it).

> I'm currently considering an FTP based system

I agree that such a system would be worth while to attempt. It would be nice if Jeff's program could "auto eMail" or "auto FTP" the day's CATCH's to the server, which would auto parse the information and store it in such a way as to allow others to "see the world" from the submitting station's point of view, after restricting the search by day of the year, or a range of days. (I'm dreaming now, of course) :o)

The website is still under development, so If you are interested in doing a translation, please feel free to do so on the existing one. Making the update is taking longer than originally thought (but your inquiry may nudge me along <smile>).

JP...thank you for your participation. The entire project is better as more of us take an active part. We're better because of your efforts in Region 1. :o)

Warm regards,
Ev

Hi, All,

I have not done the calculations but my
impression from the timing that I did on
my "lurking" while down Mexico way is
that we need a better distribution of
beacon interval times than the present
tendancy to group around 4.00 minutes.

Just a thought.

73,

Ed

Hi Ev,

I agree with Rich - I too have a daughter in college but can find $10.00 for
BEACONet. I'm having a lot of fun with this "experiment" and think maybe
we're ready to move on to another level.

Bob - KC5DUI - EM26WE

Count me in. You should set up a PayPal account to go ahead with this, or
give an address to send a check. $10 is more than worth it. But... before we
start:

1. Do we have the software in place to get this off the ground?
2. Will this software "grab" from the mailing list, or will we need to setup
an internet feed off UIView? I have a major problem doing the latter...

Thanks

694. [propnet] New installation working, sort of

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Wed, 31 Oct 2001 13:03:12 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44548-2001.10.31-15.30.40--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

On 29 October I switched my installation around:

        Old: 10 watts from DX-70, R-5 vertical, desktop computer
        New: 15-20 watts from HTX-10, Outbacker antenna over aluminum roof,
notebook computer

I was disappointed that all I can copy on the new system is W2EV and
KC5DUI. The notebook screen makes so much noise that there is a stripe
every 60 Hz or so across the passband at 28.131 (Strangely enough, it is
less intense at 28.120) These "signals" distract psk31srv so much that
sometimes it never gets to notice a real signal before it has disappeared
again.

So last night's reports were encouraging .... at least I can be heard
(marginally) in France and England . I am still experimenting with power
levels, as I find that at 25 watts my keyboard tends to lock up. Where's
that toroid?

Twice, so far, I have come to see an empty screen, and discovered that
UI-View was not logged into the server. It is possible that I forgot to
connect it once, but twice? Has this happened to anyone?

And yesterday, occasionally, psk31srv would send the preamble once,
followed by the payload two, three, or four times, on separate
lines. Anybody else seen that?

73

Really nice....

Question: (just to make sure...) do you sync your PC clock regularly?
(UIView has a add-on program that allows you to do so).

I would seem interesting that you are "shifting" 3 minutes per day. As it
becomes winter, I would expect you to "lose" a couple of minutes every day
because "sunrise" is getting later and "sunset" is getting earlier, so the
band opens earlier and closes later.

Let me think about these graphs a little more... maybe you can put a link to
the excel file on the webpage so I can download it and take a look at the
numbers?

Thanks a lot, keep up the good work

Hi Dave

The only time that I have seen that is when I adjust the time on the
computer. Just did this when I had to fix the time after Windows helped me
with the time change. I forgot to uncheck that little box.

Hi Ramon,
I update my PC clock each day with Dimension 4 mainly.
For the 3mn shift, it seems logical as sunset/sunrise follow the same
behavior.
For the data I will add a link tomorrow morning to the Excel file. I will
appreciate your point of view, as I'm not very skilled in Excel :)

Tnx for all.
JP

Hello Ed,

Thank you for your time in this.. While I disagree both philosophically
and on several data points, I'm not a Beaconet participant and thus have
other projects to champion.

73,
Bill - WA7NWP

>>>And yesterday, occasionally, psk31srv would send the preamble once,
followed by the payload two, three, or four times, on separate
lines. Anybody else seen that?<<<

It's the Use DCD option. There is so much noise present that the squelch
level stays high at times. This causes psk31srv to queue up the messages
and send them all at once .... about twelve this afternoon.

Today I have occasional copy on PA3EUG. I forgot to mention that the new
antenna is less than a meter from, and parallel to, the steel mast that
holds up my VHF antennas. And that I live at the southern base of a hill
that blocks the horizon from about 330 degrees to 70 degrees. Is ten
meters a great band or what?

Dave

And yet, TA9J has not been received by WD4RBX in the Carolinas, just a
few hundred km's away, over a 10,000 km path. Fascinating.

Dave,
Would you mind verifying and re-verifying this? If it plays out the way
you note, I'll add this info to the FAQ page as I can see it being
useful to others, in the long run.

Thanks for sharing the observation!
Ev

Though disappointed, I'm not suprised. Three years ago I attempted to
work with this group in a very gentlemanly way only to be sabotaged by a
few very parochial and short sighted members (they would discuss the
merits of the BEACONet project on a closed list...and not allow me --
the petitioner -- be involed in the discussion).

Someone will have to be the last caveman to discover fire.

Thanks for trying, Bill. :o)

The only time I've seen something like this when an incorrect video
driver is loaded on a computer that has a CRT for a monitor. I'm a bit
dumbfounded to hear that you're experiencin this on a notebook. Could
it have anything to do with the military presence just 100km away from
you?

Do the streaks go away when you turn off the transceiver (meaning that
the hash is transceiver/antenna induced)?

JP,
Very interesting data! I am assuming that your PC clock is accurate.
Thank you for sharing it with us. May I share your link with others on
the HF Beacon list, too? It is an excellent example of the power of
BEACONet.

I received an email from ta9j the other day saying that he was receiving my
beacon there as well. I would really like to see his catch.

Your outpouring of support is humbling, friends. I didn't intend to solicit contributions and now feel a bit awkward.

I'm still working a couple of issues with this product...here's the scoop:

Bill Diaz wrote software called AHub. Thankfully, he built-in support for the RFONLY alias, which makes it BEACONet friendly. The problem occurs when you use BEACONet^31, because of the use of PSK31srv. PSK31srv acts like a web-host to UI-View...which is exactly what AHub is (I think).

So...I'm not sure that this is a solution for ^31 operation...while it certainly will work for AX.25.

I guess the bottom line is to give me another few days to work the issues with Roger (author of PSK31srv) and Bill (author of AHub). I'll keep the list informed. :o)

Thank you all, sincerely.

First, there is an old (3+ years?) UNFULFILLED request for coordination that takes precedence over a current need and recognized usage.

><snip>
> > I empathize with your effort but when the folks back East decided

Second, the PNW uses a band plan that nobody else does, and they say WE should be looking at the "big picture"!

Shucks, I can QSY to another frequency to run away from
interference, but that satellite or DX I'm trying to work sure won't hear
me when I do. Doesn't sound too ingenious to me.

Y'all watch for me on 53.530 -- 24/7!

Bravo Earl. Ditto.
I'm coordinated for 53.53 operation (in New York) and have been active
there for 3-years. I wonder who should move if someone parks a repeater
on that frequency somewhere, and the band opens? Hmmmmm. ;-)

         If that happens, I won't hear it -- I don't have a speaker on the
6-meter rig, just a TNC.

Thinking about it - there shouldn't be any conflict between
packet and a repeater on the same frequency. Provided the
packet DCD is based on Squelch and not Data detect. Likewise
the folks listening to the repeater would use tone to mute
their radio's unless the repeater was transmitting.

There just may be some valuable frequency reuse here...
Considering
that most repeaters around here are quiet except for hourly
ID's...

This, to me, is a very reasonable question.

"Every thing I read on this operation indicates it is a beacon.
  If that is true, how can it operate on 53.53MHz.?
  The only FCC authorized beacons in 6 meters are
 50.06-50.08 MHz."

Bill - WA7NWP

From the ARRL letter....
I humbly nominate Bob Bruninga WA4APR for his outstanding contributions to
the development of APRS and the tenacity to get the PCsat project "off the
ground". I can't think of a person who better fits the description below.
If you agree, please make your choice known. Thanks.

 > * Dayton Hamvention awards deadline looms: The Dayton Hamvention now is

Bill,

Tell them to hit the website. http://go.to/BEACONet. There, anyone can
read about all of the other things that BEACONet can do in *addition* to
being a beacon. (hints: CW-based propagation beacons can't message
eachother, nor auto-track rovers, nor be used for meteor scatter,
nor...)

Tell them to hit the FCC rules (Part 97) and note what *kind* of beacons
are restricted to the sub-band noted. BEACONet activity doesn't follow
that definition (but then, you knew that <smile>).

Might this be an example of someone (a "repeater coordinator" maybe?)
formulating an opinion without fully researching the discussion at
hand? Sorry to sound so annoyed, but I've been down this path before
and grew tired of dealing with them.

Drop me a note off-list if you'd like to continue on this would you?
I'd prefer to keep the list full of "positive" energy and this topic
makes doing that difficult. :o)

Regards,
Ev

Hi Ev,

No, it isn't possible because there's only one TCP/IP server hook in
UI-View(32).

73 - Roger.
-- --
So...if an Internet-based system (like that enjoyed by the APRS service)
is going to be easy, it will service only AX.25 operation at this time.
Of course, this isn't a bad thing...it's just "a thing". :o)

10. [propnet] Re: International BEACONet on 53.53 MHz - notes]

From: Bill Vodall <wa7nwp@yahoo.com>
Date: Thu, 1 Nov 2001 10:06:43 -0800 (PST)
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44677-2001.11.01-12.33.22--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
> I'd prefer to keep the list full of "positive" energy and this
> topic makes doing that difficult. :o)

True - but these are real world issues.   It's the folks
on this list that are running on 53.53 which will be
affected by this.

When I reply to them this morning with the link to the
web site (again) I plan to include the following:

-----
There's no reason a repeater and BEACONet stations can't
exist on the same frequency.   Two simple configuration
details would have to be observed:

1.  The output of the repeater would include a tone.
    Stations interested in receiving the repeater would use
    the tone to break squelch.

2.  Digital stations would have to make sure they check for
    channel activity based on "Carrier Detect" instead of
    Data Detect.   They could not run "open squelch".

If the above was observed, seldom would either group notice
the shared frequency utilization.

For what its worth, I saw the same thing the other day for several minutes
and then it went away.  I'm fairly certain it wasn't anything I was doing
locally.  There is a good deal of Air Force presence lately in the sky
around my house here in the Dallas area.  Maybe?

13. [propnet] Wonder Why?

From: esack <esack@pacbell.net>
Date: Thu, 01 Nov 2001 15:25:49 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44711-2001.11.01-17.48.30--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am receiving N7YG loud and clear today.
His position is being reported as [DN42NF]
which would appear to be correct "map-
wise."

The message is apparently complete and the
"CRC" symbols are showing at the end.

However, UI-View is not reporting the receipt
of the Station on the Stations log and also
therefore, UI-Path is not recording the hits
in the Transmissions log.

Any ideas why this is occuring???

N7YG is a new and interesting
capture for me and I would like to
be able to report it.

73,

Ed

W3NRG

```
N7YG is in DM42NF so the CRC would invalidate the plot.

Bob - KC5DUI - EM26WE

PS - forecast is for thunderstorms on Friday (2 Nov) so will probably be
shutting system down this evening and will be off until Sunday afternoon due
to visit to our daughter at college.  Save all the good propagation until I
get back, PLEASE!

This is interesting, especially if you are in San Die-ego!!  Actually the
grid locator should be DM42NF.

I think you spotted the reason, Bob.
Sharp eyes!!   Thanks.

I'll watch it again carefully today.   Sort of
like knowing that big bass is right under the
boat and yet not being able to land him!!

73,

Ed

Message-ID: <LYR1548-44790-2001.11.02-04.33.57--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

2001-November-02 09:50 2 stations

Callsign	Type	Latitude	Longitude	Km	Bearing	Last Heard
+N8QLT	Grid Squ.	[EN82HL]		0.0	0	Nov 02 09:50
-KD5CFB	Grid Squ.	[EM40MJ]		1500.9	209	Nov 01 21:16

Config code, via

N8QLT	HY1E02-15,HOP2-2
KD5CFB	HY1E01-15

RX QTH: EN82HL (25 miles northwest of Detroit)
RX ANT: 40m inverted-V dipole @ 25'
TX CNF: HY1E02-15
FREQ: 28.128 USB AX.25
** All times are UTC **

KD5CFB was heard constantly throughout the day, from about 1530z through
2116z. On occasion, I noticed my beacon being digipeated by both KD5CFB, and
also by a station which did not perform callsign substitution, but came back
as "HOP2*".

Hi Ismail,
tnx for report.
I'm astonished that you didn't report me as I'm continuously receiving you
in quite good condition all day long, starting at 0630 UTC in the morning!

Pse the group, is my TX in the waterfall bad looking, or any other reason?

JP

It appears as thought you have something set to miles instead of Km. You
should be showing over 10,000 km to me. And alittle over 9,000 to w3ev, and
somewhere around 8700 km to pa3eug.

31. [propnet] PSK31svr question

From: RickfordG@aol.com
Date: Fri, 2 Nov 2001 15:30:28 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44864-2001.11.02-14.57.25--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

I was wondering if any of you all have had this happen and if so what did you
find?

I have had PSK31svr crash at least 3 times. Every thing would be happily
running for day, weeks on end and all of a sudden PSK31svr crashes and burns
"Me up."

Today really got my goat! I was having a very interesting band opening to
PA3EUG. I rarely received more than a hand full of Ramons (complete) beacons
a week. I constantly receive partials from Ev & Ramon. Today I had 8 plotted
in one hour and 3 in the next of Ramons beacon. That's when disaster struck
PSK31svr crashed.I didn't find out till about 3 hours later.

Talk about tearing a hole in your net!

Rich

Not much AX.25 activity lately...still, the AGW packet engine is quite
stable on my computer while the PSK31SRV software isn't. I've had it lock
on transmit several times and haven't been able to debug the problem yet.
So I'll be using AX.25 on the days when I can't be at home.

Dear Friend Philippe

Yesteday, I had transmit on 28.132 all day long. I had noticed it at
evining. May CATCH report is only 2 hours.

37. [propnet] Mexican Catches 10-22-01 to 10-26-01

From: esack <esack@pacbell.net>
Date: Sat, 03 Nov 2001 02:29:44 -0800

To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44944-2001.11.03-04.52.29--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello All,

I have sent to Ev as an attachment, the summarized
data from my BEACONet PSK31 recordings for
the period 10-22-01 to 10-26-01. These days
we were in port in Mazalan, La Paz, Santa
Rosalia, Loreto and Cabo San Lucas, Mexico.
(For those without a handy map, these are
harbors adjoining or in the Sea of Cortez.)

What one can glean from the data is that
the lower latitude U.S. stations were favored
(the old East-West bias to the skip).

Also, WD4RBX was received several times
on his solar powered beacon and good old
F5SMZ gets into Mexico just fine.

I'll leave it up to Ev to publish the details.

73,

Ed

> I have had PSK31svr crash at least 3 times. Every thing would
> be happily running for day, weeks on end and all of a sudden
> PSK31svr crashes and burns "Me up."

I have had PSK31srv "lock up" only when I'm down to under 70% resources
on my WindowsME Pentium computer. I'm really looking forward to
installing WindowsXP because of the resource hog that ME has turned out
to be.

Maybe there's a relationship there for you to explore, too.

39. [propnet] Catch a falling Leonid

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 02 Nov 2001 18:05:43 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44950-2001.11.03-07.22.33--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

According to a source that proved quite reliable in predicting last
year's peak, this year's Leonids may be the best of our lifetime. Then
again...

<smile>

Asher and McNaught now predict the following:
2001 Nov 18, 0955 UT - rate, 800 per hour, over the Americas.
2001 Nov 18, 1724 UT - rate, 2000 per hour, over E. Australia, E. Asia.
2001 Nov 18, 1813 UT - rate, 8000 per hour, over W. Australia, SE &
Central

Asia.
(The peaks are expected to be very short and sharp).

The power of BEACONet is the fact that we can operate throughout the
days immediately prior to and after the predicted peak...and actually
verify the results of the prediction! Unlike our "hunting" brothers
(who have no way to operate for more than a handfull of hours at a
strech), we can watch the event unfold before our eyes...and document
our findings with LOGs.

Get Meteor Mode ready now...the fun is about to begin!

 28.128 MHz USB
 53.530 MHz FM - and an alternate frequency of 50.450 USB
147.585 MHz FM
223.780 MHz FM (anybody want to give it a go with me here?)

Get at least 100 watts of ERP (100-watts to a 1/2 wave vertical should
just about do it) and get ready to hear and be heard!

Rendered body type: text/plain

In my never ending quest to make sure that the data that we receive is
correlated against known solar quantities, I asked the question as to
where such solar statistics are available (in text form) on the web. A
future BEACONet-er <smile> replied with the following information.

It's just FYI for now...but we'll find a way to incorporate it either in
a future DATArchive system or something similar (like...wouldn't it be
cool to include SFI, K- and A-index information in our [CATCH]
reports?).

Anyway...here you go...

> Not much AX.25 activity lately...

Hi Dave,
Yes, it's a shame, really. It's quite a nice mode to use. I'm
encouraged that you heard me. Although I didn't have time to verify...I
should be at the 10-watt level. Keep the faith...BEACONet (AX.25) is
about to get a real boost. I'm going to setup an AHub server and try to
run it next weekend for 4-hours during the day (that's how long the
trial version runs). It will give us some insights into just how well a
"LIVExchange" server system would work for us. More info shortly!

Hi Ev,
in order to help the project running, are you expecting a special action
from me in Europe, tell me ...

10.131 TRX ?
switch to AX25 ?
start 6m operations ?
start VHF TRX ?

Just let me know, which added value can I bring to the project.
(i can continue transmitting on 10m and start operating in parallel on
another band)

:) de JP, BeacoNet enthusiast F(roggies) :)

48. [propnet] Mailer Version 2

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sat, 3 Nov 2001 16:25:05 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-44999-2001.11.03-10.51.40--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Been working on a rewrite of UiMailer for the past week or so. I have
updated my development software and I now have a beta of version 2 working.
Below is the mail message I sent myself as a test.

As you can see I have added a table of stations heard and the number of
'catches' heard each hour. The numbers I am displaying are in hexadecimal
as it was hard to place a number greater than 9 in a space designed for 1
character. Therefore, for those not up on hex, here is the conversion

    10 - A
    11 - B
    12 - C
    13 - D
    14 - E
    15 - F

I do not assume to have more than 15 catches per hour, If that becomes a
problem then I will look at another method of displaying the catches.

I have not included the configuration code at this time, but when we come to
a consensus as what we would like to see of this code than I will add it.
The problem I am having now is the fact that some version of UiView will not
pass the SSID, the two characters to the right of the hyphen. Until we can
resolve that issue, it becomes very hard trying to capture the configuration
code when I do not know if it's 6 character long or 9 character long.

Assuming I don't have some other 'feature' arise between now and 2359, you
should see a completed email including everything from about 1600 UTC on.

Hi Jeff,

first of all, thanks for all the effort on UIMailer. I think, next to UIView and PSK31Srv, it has become BEACONet(^31)'s most valuable piece of software in no-time... thanks again and keep up the good work!

About your suggested HEX reporting algorithm, that would work, but only partially. I am considering doing a snapshot every 1 minute (so the theoretical max. number of hits per hour would be 60), which would kindof be impossible to report with your implementation. Right now, I snapshot every 5 minutes (max hits/hr=12). Of course, the 60 hits per hour is only theoretical, but around 30 hits (for stations that transmit every 2 minutes) should be reasonable.

Reason I want to report more accurately, is to assess propagation conditions based on the number of hits per hour (1 hit = 1 successfully received CRC'd station). I did that before already using my parsing program and it seemed to work pretty well!

A good solution could be to make UIMailer base-36 instead of hex (base-16). Base-36 would then be 0-9 followed by A-Z. That case I could take a snapshot every 2 minutes (good compromise) and take it from there. Would this be possible/difficult to do?

Thanks,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Rendered body type: text/plain

>From time to time I see folks wonder about
strange things that happen when using these

programs together with this Microsoft
Operating System or that.

Here are my experiences with a good
install of Windows 98, Version 2.

#1. From time to time, the BEACON
message is being sent to the transceiver
but the transceiver is not keyed on
(using the RASCAL). A restart
of UI-View seems to fix that.

#2. From time to time, an interrogation
of UI-Path or UI-View as to what
stations have been logged is taken by
the UI-View program as a signal to
send an extra BEACONet string for me.

#3. From time to time, UI-Path loses
its connection to UI-View even though
I have them in the same folder.

#4. Occasionally albeit rarely, the
UI-View "transceiver key" signal
will come on and not go off.

As with all things, I am sure that these
artifacts are computer dependent but
at least these are my experiences.

Others' experiences??

73,

Ed

Rendered body type: text/plain

Jeff,
You are to be applauded for your efforts.

Your use of Hex is very insightful. This especially, given that 1 TX
every 4-minutes = 15 possible catches per hour in a simplex system such
as BEACONet^31. TX intervals any shorter than this would be difficult
to support as more people join us on this service.

Of course, in a non-simplex system such as BEACONet I suppose that it
would be possible to have three times that rate with a HOP2-2
request...but maybe that's a problem to solve on another day.

The alternative would be to format something like this (leaving space
for "tens"):
           0 0 0 0 0 0 0 0 0 0 1 1 1 1 1 1 1 1 1 2 2 2 2
           0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3

N7YG   2
WD4RBX   1

Either way...UI-Mailer is just the product we've been needing for a long
time. Well done.

Ev, W2EV

Thank you Ev!

It was a just barely kind of thingy. There was a DL CW station working DX
that was reeking havoc. I only plotted two of his beacons out of many. Hey!
one is enough ;-)

> to work pretty well!

Actually, Taking a snapshot every minute is deceptive. All the snap shot
does is takes a 'picture' of what is displayed on the UiView map. UiView
retains a map plot for quite some time even though you have not heard the
station in quite some time. Of course that is adjustable, I have mine set
to 144 min which is a bit over 2 hours. I think somewhere in the setup on
the Beacon Net Web site it actually has you set this value to 1440 minutes.
So, even though you take a shot every minute, that does not garuntee you got
a clean catch. In fact, with most stations sending out a beacon every ten
minutes or so, the effectiveness of this method is now decreased
considerably.

This is why I have selected a different method to catch a complete beacon.
I am using the DDE service provided in UiVew to catch everything that is
sent to UiView as a complete beacon.   basically, everythong that appears in
the message window is sent to my program via the Dynamic Data Exchange
service of Windows. I thne look at the string of characters to determine if
it contains valid beacon data. If so, then it is a vaild catch and
processed as such incrementing the hourly hit counter.

> A good solution could be to make UIMailer base-36 instead of hex
(base-16).

This is a great idea and implementing it shold not be a problem.

Actually, Rich made a great suggestion to use Base 36 and that would
encompass 1 -9 and A-Z to represent a total of 35 possible numbers. This
will be very easy to implement.

Rendered body type: text/plain

Hi all,
suffered many PC crashs today, so manual report in order to continue to
contribute.

Received stations:
TA9J all day long
N2VRJ received VERY WEAK today and diffcult to decode Jesse.
PA3EUG received as usual
WD4RBX was coming very STRONG today.

Also heard G4FHN and KC5CFB around 1700 UTC.

I apologize for this report, and it's in these moments that you can feel
that Jeff's UI-Mailer MAKE LIFE EASY :) Tnx Jeff for all your efforts, and
as Ev wrote yesterday, UI-Mailer is the first piece of sofware dedicated to
BeacoNet, and a very useful software.

Hi, JP all

I really got relay pi**ed off today! I was trying to run Jef's 2.0 Bata
version and some S**T Head was jamming the freq. I switched to my Yaesu 767
and 90 watts to a 6 element beam pointed at you. The jammer was in your
direction!

If the FCC asks I was trying to make a 2 way with TA9J who so far has not
heard me. This is partially true! Good reason to crank her up!

JP

Sorry to hear about the computer crash. I also just had one, the "old blue
screen of death" as I was downloading mail.

As such Until I can figure out what Microsoft has done this time, my beacon
is off the air for a day or two.

Jeff

I received the WD4RB but its position didn't view on UI-VIEW map.

Rendered body type: text/plain

Just to give you additional info.
WD4RBX lost at 20:12 UTC
PA3EUG lost at 21:05 UTC

Band is now completely silent.

Comments on your comments :-)

you are right but that's not the way I have been using the snapshots. I
implemented an algorithm ONLY to count something as a hit IF the timestamp
changed since last occurance in the Snapshot file. So if something is
different from last snapshot... it must have been a HIT !

As for the screen display. I keep my data around for 24 hours. At 23:59, I
have a scheduled event that EXITS UI-View. In Windows Scheduler, I run a
batch file every day at 0:00 that does the following:

- delete ...\uiview-32\saved*.bin -> this cleans out your heard stations
list at once
- restart UIVIEW

That way, I keep every snapshot file clean over an exact 24 hour period,
with cumulative data for the day in it. It's always nice to come home after
work and see who's been on that day.

By the way, what I also do: between 10 AM and 6 PM, I send myself a copy of
the "current status" using UIMailer to my work email. That way I can keep
track of progress during the day... :-)

Thanks again for your efforts.... UIMailer RULEZ ((: had to emulate my
18-year-old brother-in-law for a second here...)

I've wondered about the accuracy of UI-Mailer reports, given that they
really *must* be accurate to the 24-hour period in which they are
generated. It does no good to keep propagation data longer than
that...and really ought to be reset at midnight-UTC.

Ramon...would you mind putting together a detailed list of directions as
to how to setup things to do what you do? I seem to remember you doing
something like this earlier, but I can't seem to locate it.

It would be helpful for all if you could...and I will work it into the
BEACONet setup instructions on the web site (it's *that* important). :o)

>   Sun-Earth Alert
>
>   Solar Terrestrial Dispatch
>   http://www.spacew.com
>
>   05 November 2001
>
>   Details, images, and movies:
>   http://www.spacew.com/astroalert.html
>
>   A significant and powerful solar flare (X-class event, the most powerful
>class of x-ray flares rated) exploded from active sunspot complex number 9684
>at 16:19 UTC (11:19 pm EST) on 04 November. Less than 20 minutes later, a
>barrage of highly energetic particles (protons with energies greater than 100

>million electron volts) travelling at near the speed of light began flooding
>the near-Earth space environment. At the same time, a large coronal mass
>ejection (CME) was observed by the Solar and Heliospheric Observatory (SOHO)
>spacecraft's Large Angle and Spectrometric Coronagraph Experiment (LASCO)
>cameras. The trajectory of the ejected mass was quickly determined to be
>Earth-directed based on the halo of light that was observed propagating
>outward from the Sun with each of the LASCO images that were received.
>
>   The velocity of the coronal mass ejection was estimated to be relatively
>high (at least 1,000 km/sec). The ejected mass formed a shock wave in the
>inner-corona of the Sun. The shock wave excited electrons as it propagated
>outward, resulting in a loud radio emission known as a Type II sweep
>frequency event. As the shock wave propagated outward to regions of lower
>electron density, the observed radio emissions also decreased in frequency.
>Through the use of models that describe how electron densities decrease with
>altitude through the solar corona, it is possible to estimate the velocity
>with which the responsible shock wave propagated outward through the corona.
>The results thus far suggest the shock wave may have been travelling at a
>velocity in excess of 1,300 kilometers per second (4.68 million kilometers
>per hour or almost 3 million miles per hour). A spacecraft moving that fast
>(still a dream by todays standards) would be able to traverse the distance
>from the Earth to the Moon in less than 5 minutes!
>
>   The CME is predicted to impact the Earth near 06:00 UTC on 06 November
>(11 pm EST on **05** November for North American observers), +/- up to 8
>hours. The arrival of this disturbance is expected to produce a potentially
>strong auroral storm. Observers interested in watching for the "Northern
>Lights" are therefore encouraged to watch the skies of 05 and 06 November for
>activity. A fairly strong light show is possible on those dates.
>
>   Additional information, including images and movies of the solar flare,
>are available at: http://www.spacew.com/astroalert.html
>
>   Additional major solar flares are possible over the next 3 to 5 days.

What's the URL for that handy configuration code calculator? I seem to
have lost it a month or three ago when I formatted and reloaded everything.

```
        Thanks,
        Earl

83. [propnet] Switching between PSK and AX25

```
From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Mon, 5 Nov 2001 17:40:21 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-45333-2001.11.05-12.08.46--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

Have you a need to switch between PSK and AX25 without having to reconfigure
UiView? Well, here is a neat way to accomplish such a feat without having
to reconfigure the initialization files each time. Basically you are going
to create 2 MSDOS batch files that will do all the work for you.

Using your favorite text editor create the following batch files:

RUNAX25.BAT

```
@echo off
copy ax25cfg.ini uiview32.ini
copy ax25schd.txt schedule.txt
cd c:\agwpe
call "AGW Packet Engine.exe"
rem call uiview32.exe
```

Save this file in the Peak Systems\UI-View32 folder. Note: if you are not
using AGWPE packet engine, the remove the REM on the last line and place A
REM at the beginning of the 2 line above the last line.

Create another batch file
RUNPSK.EXE

@echo off
copy pskcfg.ini uiview32.ini
copy pskschd.txt schedule.txt
cd "..\psk31srv"
call "psk31srv.exe"
cd "..\ui-view32"
call "uiview32.exe"

Save this file in the Peak Systems\UI-View32 folder.

Setting up PSK Mode
Launch UIView and set everything up for PSK mode including whatever you have
in the Schedule editor. Once you are satisfied that everything is set
correctly, quit uiview and find the configuration file called uiview32.ini
in the Peak Systems\UI-View32 folder. Copy this file to a new file called
pskcfg.ini. Copy the file Schedule.txt to a file called pskschd.txt.

Setting up AX25 MODE
Launch UiView and set everything up for AX25 mode including what ever you
have in the Schedule editor. Once you are satisfied that everything is set
correctly, quit uiview and find the configuration file called uiview32.ini
in the Peak Systems\UI-View32 folder. Copy this file to a new file called
ax25cfg.ini. Copy the file Schedule.txt to a file called ax25schd.txt.

Using you handy-dandy file manager, find the 2 batch files you created and
right click the file name. Select properties and select the check box for
'Close on Exit'. Also select the windows mode of minimized in the drop down
box. Select an appropriate icon and click OK. Do the same for the other
batch file.

You can now create a shortcut on the desk top to each of the batch files.

Note: If you are running the AGWPE packet engine, make sure you close AGWPE
separately prior to launching PSK or you will get an error trying to address
the sound card. Also note, these batch files assume you have everything
installed in their default directories. Adjustment will be required for non
standard installations.

90. [propnet] Operating BeacoNet31 on 2m/70cm

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Mon, 5 Nov 2001 21:41:56 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-45347-2001.11.05-15.11.44--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,
I've started considering this evening (21:20 local) to do some new BeacoNet
tests in PSK31 on VHF.

I would like to put on air a BeacoNet beacon in PSK31 to probe in real time
propagation on 2m around me. So I need some european participants to
cooperate in the project. Jeff's future release of his UI-Mailer will be a
great tool for plotting the reception.
G4FHN and S57MHA would you follow me if possible on your side?

I would also probe and quantify the effects of Aurora reflection on PSK31
signals, hence see if they are really affected by the well-known Doppler
variation against Aurora and how they could sound like.

I think in the coming days, find first a right chosen frequency and some
"local" stations in Europe to spend some time listening the PSK beacon
transmitting every 1mn with CW ID (alternatively) and monitor the possible
RX differences.

The station will also probe Meteor scatter.

I'm ready to start with 30W in an 9 elts beam or 17, or perhaps an Halo,
what is your feeling about the choice of antenna? Power could be in a second
step upgraded to 400W from a linear 2x4CX250.

That's sounds interesting to myself and hope there will be enough interest
to make stations join me for these initial tests. I hope to discover some
interesting things perhaps, or confirm what we know currently.

BeacoNet is really a GREAT idea, "Monitor Propagation/Beacons on a SINGLE
frequency", that's really POWERFUL.

Another "stupid" thing I need also to solve is how to make a HUB/RF-BRIDGE
using both PSK31 and AX25 on different bands, providing via an additional
dedicated way (VHF APRS FREQ) a Real-time reporting of various BeacoNet
freqs/bands to others.
I'm digging...

73 de JP, F5SMZ

Just who will be active for the Leonids 2001 event? No more guessing!
Register your intent to operate and let everyone know where to point
antennas. This is the one "hunting" application of BEACONet. Thanks to
Rich Parry for his web work!

Please...take a moment to register. I already have.

Ev, W2EV

- -

Leonids METEORegistry Registration:

If you will be participating in the Leonids Meteor Scatter event, the
METEORegistry web page is now available. The purpose of registering is
to
provide a real-time list of participants to expedite communication and
increase the chances of success. There are 9 questions, it takes about 1
minute to complete. The Leonids MS event is from about Nov 14 to Nov 21
with a Nov 18 peak.

Click on the URL below and then click on the "Register here" link.
http://go.to/METEORegistry

We now have a year of MS events and all registrants are in the database.
You can easily see the participants from previous events.

good luck,
Rich Parry

Excellent idea, JP. This works well with a vision of establishing a
TransAtlantic 2-meter BEACONet^31 system during the summer of 2002!
Please experiment and share the results with us.

I've always wondered just "how close" in frequency two 2-meter stations
could get without hearing eachother (as would be the case across the
Atlantic). Would they be close enough for PSK31srv to scan and lock,
should the band open?

Your work would do two things:
o Answer the above question -and-
o Start getting some active stations in Europe to take advantage
  of a transatlantic attempt

I can tell you that N2VRJ is interested in being active on 2-meter
(either PSK31 or AX.25) in an attempt to make it across the ocean. The
problem is that there isn't anyone else in normal range at his location
with which to test. He has a Yaesu FT-290r Mark II (25-watts) and is
presently looking for an antenna in the 6 to 12 element range. He
doesn't have an amplifier yet, but that's in the range of possibility to
add (though PSK31 may not require high power).

Well done!
Ev,W2EV

Rendered body type: text/plain

```
Hi all,
since some days I was revceiving a strong signal at the right of the
waterfall, and I was wondering it's mode and origin. It was transmitting at
regular intervals.
It's AX25 300bds on 28.131.5 USB

Here is a quick catch today:
18:25:28R EA8ADH-4>APRS,DL0MNL Port=3 <UI Len=62>:
QTCÄ¿urjente para
    ÀÄÄÄÄÄ>> EA8BYG EB8ANR EB8BQU EB8ROK
18:28:24R EA8ADH-5>ID Port=3 <UI C Len=240>:
[ binary data ]
18:30:29R EA8ADH-4>APRS,DL0MNL Port=3 <UI Len=62>:
QTCÄ¿urjente para
    ÀÄÄÄÄÄ>> EA8BYG EB8ANR EB8BQU EB8ROK

...from Canary Islands (approx IL18) and 3000kms from my QTH)

Did you notice this station. Here I can receive it all day long.

73 de JP

PS: we have no BeacoNet station in this area but I can now use it for
monitoring in this direction, since now I know his QTH.

Rendered body type: text/plain

Hi there,I have a fault on the rig at present and can not TX on 2m but could
listen for you or alternatively I can run 20W on 70 cm.
I have a 9ele for 2m and 19ele for 70cm,both are vertically polarised but I
will change them to horizontal as soon as WX permits.I have a reasonable
path in your direction.
Please let me know your proposed operating times and frequencies

Regards de G4FHN Bob

I am up and running... see my attached intermediary report.

There was a major Aurora warning, which probably completely hosed HF.

ps. I will be again in France arriving on Thursday, leaving Friday morning
back home :-)

Hi JP,
Is there any chance you can tell him about 28.128 @ 1200 baud and ask
him to QSY to where the rest of us are? It would be great to have him
plotting with the rest of us there, if he will move. :o)

Jake, K8JWT (FM09ap), Qrpvhf@aol.com wrote:
> Just wondering, has anyone found any digital system to
> work Au with? other than good old CW...

Hi Jake,
Here's food for thought...
o The issue of communication ability (via any propagation mode)
  is *generally* less dependent on mode or frequency than it is
  dependent on the level of signal attainable on the RX-side (and
  "yes" there are several factors that come into play there).
  - A 1-watt CW signal on 50-MHz may not propagate via aurora,
    while a 1000-watt voice signal on 432-MHz may very well
    propagate.
  - A 10mW, 17dBi feedhorn'd X-band transceiver may not propagate
    over a rain-scatter path, but a 100-mW 2-foot dish'd station
    may very well.

o Just because no one has been successful, to date, in
  the Amateur community does not make a task impossible.
  - "Short Waves" were useless spectrum until someone tried 'em.
  - The Leonids meteor shower "didn't exist" in 1932, according
    to an old VHF Handbook that I have.
  - The 5-meter band (as it was at the time) was useless for DX
    propagation until the 1940's, when that was proven wrong.
  - EME was impossible (at Amateur power levels) until the early
    1960's
  - Es's MUF used to be 144 MHz...until *that* was proven to be
    wrong in the 1980's with the first of several 220/222-MHz
    contacts being established.
  - Digital modes cannot be supported on Meteor Scatter paths, due
    to a number of factors, including Doppler, phase shift and
    Amateor power levels? Tell that to W0RPK in Iowa, who did it
    in 1985 on 6-meters...and the *BUNCH* of folks who will be using
    "packet" technology (http://go.to/BEACONet) and other digital
    technologies (WSJT) in *this* year's Leonids shower.

Who will be the first Amateur to apply a digital technology to an aurora
contact? Who will be the first person to not only free themselves of
"yesterday's" thinking and have the patience and tenacity to make it
happen? You, maybe? :o) Now, THAT would be cool, wouldn't it?!

Yesterday's knowledge does not make tomorrow's truth.

Ev, W2EV
PS...this note has been cc:'d to the BEACONet/PropNET listserve on the
Tucson Amateur Packet Radio system because you'll find other open minds
there, too. It is a "closed for spam" list, so you need to be a member
in order to post or cc: it successfully. Join us, would you?

116. [propnet] Digital Modes and the Narrowband Operator

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 07 Nov 2001 07:03:11 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Cc: BEACONet/PropNET eMail Remailer <propnet@lists.tapr.org>
Message-ID: <LYR1548-45659-2001.11.07-06.31.54--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

These are not junxtaposed terms. Digital modes can enhance the
Narrowband experience, when viewed in new and exciting ways:

o Brendan Trophies: Imagine a network of digital beacons along
  the Atlantic coasts of North America and Europe. Digital, in the
  sense of using either PSK31 or AX.25 (UI) to not only constantly
  bathe the sky with propagation-seeking RF, but with computers

attached to them to actually *alert* the host station to an opening in progress (or building). Flip to CW or SSB and make the contact and put the trophies on the fireplace mantle.

o Meteor Shower Study: Let your digital station run from November 16th through 20th, again bathing the sky with RF. Study the computer log to see if *you* have data to support a "peak" or multiple "peaks", just like the paid scientists try to do. Of course, do it between your normal operating times.

o Track VHF Contest rovers by attaching a GPS to a digital beacon which automatically transmits the Rover's location so that others will know when one is in-range and setup to make contact on the 12-bands you've got. Of course...all in simplex, non-digipeated ways.

o Track VHF band openings in real-time. This system has been quite popular on the 10-meter band (28.128 MHz USB using AX.25 and 28.131 MHz USB using PSK31) for quite some time. There is no reason that it couldn't also be just as popular on 6- or 2-meters...other than the level of participation there has been lower. Often, people use this system to know when 10-meters is open and they go DX-chasing when notified...and come back when they're done so they don't miss the next opening.

I'm not talking about your daddy's packet radio here. :o) Information on one narrowband-friendly (and originally developed with the VHF narrowband enthusiast in mind) digital mode called BEACONet may be found at http://go.to/BEACONet.

Free your mind. The possibilities are astounding.

Ev, W2EV

Jeff,
W-O-W!  This is fantastic.  Here's hoping the test goes well.  Now, if
you could only figure out how to automatically include the configuration
code we'd be in blissful nirvana. :o)  Well done!
Ev, W2EV

134. [propnet] Re: [CATCH] N7YG BEACONet^31 - 11/07/01

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Thu, 8 Nov 2001 03:24:24 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-45814-2001.11.07-21.51.15--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I can include the confide code. That's not a problem. The problem is those
versions of UI_view that do not pass the complete config code. I can try an
add it and see what happens. I will tack it to the end of the string so it
does not 'move' everything else around if I get a screwy code.

Jeff

PS I think I have beat this puppy into submission and it now sorts the
antipode.

Rendered body type: text/plain

FYI...

By the way...the "0300 UTC" that the author mentions was later corrected
in an eMail to read "0300 CST". Still, interesting information. Let's
see if actual BEACONet data supports the predictions!

Get ready for AX.25 BEACONet during the Leonids! 10-days 'till the
event. Get going, already! :o)

Ev, W2EV

Hi all
I got this from the NASA web site. I am going to be in a good position for
the event. I will be getting off from work (night shift) Saturday morning and
will be off for about a week. My plans are to sleep all day and stay up all
night. I want a front row seat for this one.

Ill be checking out the equipment this weekend and registering at the meteor
BEACOnet web site. I am looking at running 223 and possibly 53 MHz.

THE TIME
THE FORECAST (ZHR)

 North America
 9:00 - 11:00 UT
Sunday Morning, Nov 18th:
4:00 - 6:00 a.m. in New York
1:00 - 3:00 a.m. in Los Angeles
 800 - 4000 per hour

Have you had a problem with ui-view not communicating with the mailer. I discovered today that for some
 reason, after about 1644 UTC or so, I got no more data catches sent from uiview to the mailer program.
  I seem to remember somebody had a similar problem between UI-Path and uiview???

Hi Jeff,

Like the looks of the new UIMailer - I've had my computer sending me a report every hour during the day so I can see what is happening. Is interesting to see stations come and go!

At one time I think you mentioned using batch files to switch modes for UI-View. I've been using a VBS file (if I remember correctly it is on the UI-View site) that sort of automates things. You make copies of the VBS file with different names and when you run them they get your configuration from a directory with the name of the VBS file and then save changes back when you exit. I've got ones for Meteor and Normal Packet plus PSK31 at 15 minute intervals and PSK31 at 7 minute intervals. UI-View runs the 15 minute interval during the evening/night and switches to 7 minutes at 1200Z when propagation improves then back to 15 minutes at 2200Z when my wife gets home and uses the other computer. ((I have an RFI problem that developed when I switched our cable modem from a hub and coax to a router/switch and Cat5 cable - when the rig is transmitting network traffic stops so I've gone to a longer interval when my wife might be using the computer until I can figure out how to cure the problem.))

Awaiting the release of UIMailer 2.0 - appreciate your work!!

Bob - KC5DUI

Yep! was just going to write you and let you know that at about 12:00
UImailer quit collecting data. The program was still running.

I noticed this morning that UImailer plotted 2 hits (my station) several
hours in the future in the station list.

Glad to help!

BoB

Been seeing you beacon regularly now.

As for the VBS file. Roger told me about that, but I have problems with VB
Script. I just will not use it because of the security problem with VB
script. About the only way I can use VB script is to lock down my computer
such that I can not access any internet sockets. Just will not work with
trying to access PSKSrv, UI-View and AGWPE all on a local socket. I have a
full time connection to the internet so it really does pose a problem on
this end. I don't switch between AX25 and PSK all that often, so the batch
files work rather nicely. Think I will create on for meteor mode also.

Today I found a rather nasty problem with the way I connect to Ui-View
using the DDE service of windows. So I am rewriting my connection service
to use the TCP sockets of UI-VIEW, PSKServ and AGWPE. It seems to be
working much better than the DDE service, and I have a lot less overhead.
So it will be a bit longer before I will release version 2. Need to get as
many 'features' (bugs) out before I let it go.

Though may be you had that problem. Not sure what is causing that, but I suspect it some sort of memory
 leak in the windows API.

Fear not! I have another solution. I am going to use the same concept that PSKserv and UI-View use to
communicate, via a TCP socket. I discovered that not only does PSKsrv act and an TCP server, So does
UiView (on port 1448). So I am dumping the DDE crap and I have redesigned using TCP socket service.
This will also allow connection to AGWPE directly. Actually, if all you want to do is monitor, then
with this version all you really need to do is run PSKSrv or AGWPE and the mailer will collect all the
same information that is sent to UI-VIEW. UI-View will still need to be run in the event you want to
send a beacon.

168. [propnet] World-wide 6-meter BEACONet (.25 and ^31)?

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 10 Nov 2001 08:30:14 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46170-2001.11.10-07.59.05--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

It is becoming painfully obvious that the *best* frequency for BEACONet
operation will probably never be populated for propagagion research.
There are *many* reasons why 53.53 MHz is a best choice for such things,
but the dirth of equipment and lack of willingness of people to actually
build a simple vertical dipole for that frequency is discouraging.

First: I am not suggesting the abandoning of 53.53. There are other
applications for BEACONet that can and will use it (including VHF
Contest Rover tracking). As a percent of frequency, this choice
provides the least opportunity for self-qrm of any other VHF band
through 2-GHz!

What I *am* proposing is the establishment of a "SSB" modulated
frequency for BEACONet operation in the 6-meter band (much like we have
on 10-meters at 28.128 USB).

Here's the thought: 50.450-MHz USB @ 1200 baud. This frequency is at
the "upper range" of a typical SWR curve for an existing narroband
operators antenna installation, and may encourage some of them to join
us. Carrying this thought to the next logical conclusion: the placement
of BEACONet^31 on 50.431 USB + 1500 hz.

This would provide a placement of the service in a more "international"
part of the band as well, possibly encouraging a more world-wide
participation base.

Any other thoughts on this?

Ev, W2EV

169. [propnet] 2-meter TransAtlantic Frequency?

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 10 Nov 2001 08:43:17 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46171-2001.11.10-08.12.06--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

With next year's transatlantic opportunities being pondered, I was
thinking about how to best mount the assault. The first thing is to

find a frequency for each mode of BEACONet (.25 and ^31). Here are my
first thoughts:

BEACONet.25:

Frequency: 144.89 .90 .91 .92 .93 .94 .95 .96 .97 .98 .99 .00 .10
RSGB   ~~~ Digital Communications ~~~~~~~~~~~~~~~~|
ARRL |~~~ Digital Communications (odd channels)~~~~~

It seems that 144.99 MHz holds good promise for AX.25 BEACONet. It is
far enough away from 144.2 that we may be able to gather some interest
from the narrowband community to host a BEACONet.25 operation, aimed
into the Atlantic.

BEACONet^31:
The choices are "low" or "high" in the segment from 144.1 to 144.3 MHz.
If "low", then I would suggest 144.131 USB + 1500hz. Downside: we can't
go below 144.1 because that is CW only, and *someone*, somewhere will
bring it to our attention that 144.131 is often used for EME work. I
don't believe this will cause much hardship, though...but it *will* come
up for discussion.

If "high" then we contend with the USA allocation for CW-based
propagation beacons and the start of the FM repeater sub-band above
144.310 in some areas of the USA. This may make 144.301-MHz USB + 1500
hz a good choice. Other than that, there are "holes" in the CW
propagation beacon sub-band that we could land on.

Again, I'm looking for some input before we need to make a decision.
Any thoughts?

Ev, W2EV

Hi Ev,

In order to do this, you will have to take into account the European 2-m
bandplan, which is very different from the US. I will send you this plan
(scanned from a VERON "vademecum" (Dutch ARRL equiv. "Ham Radio Handbook")
in a separate mail, but I already know that you need to stear away from
145.000 since that's a repeater input.
Also, since we are listening to Europe, we should take into account the
pan-European bandplan rather than just the UK (RSGB) one, since IF condx
exist to the UK, you probably want to avoid QRM from other European users. 2
Meters are really popular there, also for DX !!

I would like to actively participate in this effort. Since I live in Boston,
with open view to the northeast, at about 3 miles from the ocean, I may be
able to set up a station. However, what I lack is equipment at the moment.

If interested, I can poll the BARC (Boston A.R.C.) if there are any good
sites to set up an unmanned station.

In the mean time, we should start thinking what the best propagation mode
is. I have experience both with Tropo, E-s, and Aurora. To be honest, from a
European point of view, E-s will only work southwards (I worked PA-ZB in E-s
with 25 Watts !). Tropo works up to about 1500 km, but gets harder after
that. Aurora sounds very reasonable (as you can reflect off the pole, and
many stations can be worked towards the northwest from Europe), but how's
that from the US? Aren't we too far south? Does PSK31 survive the Aurora
phase distortion?

>From the Americas, the best chance is probably to set up a station somwhere
in Newfoundlans, in Gander or so. Do we know any HAM operators there that
maybe able to help us?

Thanks,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

I am not sure how PSK31 will react to E-layer and Aurora, but from some
early work with PSK on 17 meters a 2 years ago, I do know that I had a 1
hour QSO with a station in VK, on back scatter. The VK station was using
500mW to a dipole type antenna and I was using a 40 meter Windom with the
automatic ATU in my HF rig. I was running about 10 watts at the time.

So I suspect, without a lot of phase distortion, Aurora type Propagation
would be suitable for PSK,

Hi, Jeff,

In my experience, PSK31 is reasonably robust phase distortion wise if one is willing to turn off the CRC and "read through the boo-boo's"

There was all kinds of phase distortion in my recording of the daily 28.131mh BEACONet transmissions "speaker to microphone" when I was on that trip down to the Sea of Cortez in October. Add to that the deck noise, ship vibration and far more QRM (Mexican Public Service style!) than one hears on that frequency here in the U.S.

And yet, I was able to identify about 90% of the transmissions that I recorded.

Yeah, sometimes I had to use the location grid or the configuration code as a hint as to a missing element in the call letters but bottom line, the experiment was pretty successful.

73,

Ed

Hi all,

Have been doing some experimenting this morning. The radio computer is running UI-View32/PSK31Srv while another computer is running Digipan in the scan mode. I'd seen several reports from F5SMZ showing he'd received me but I haven't been copying him. Discovered he was outside my search range - I'd set up 200Hz centered on 1500Hz and he is showing at 1711-1749Hz - moved the center of the scan up to 1600Hz and have been getting partial info so far today (not a strong path for us). Since Digipan in the scan mode is kind enough to log frequency thought some might find this interesting (of course this just what my combo of rig/soundcard shows).

W3NRG - 28.132.499
KF6XA - 28.132.551
PA3EUG - 28.132.502
N7YG - 28.132.500
F5SMZ - 28.132.711 (28.132.749 around 1500Z)

Digipan also has a TOUGH time locking on to PA3EUG - will stop on the signal without decoding then continue scanning passing the signal several times even though it is strong. At times PSK31Srv appears to lock on to the right (high) side of the PA3EUG signal and not decode anything - other times it centers nicely and decodes smoothly. Haven't noticed this on other signals yet but will try to keep watching.

Have to go rake some leaves now so will have to leave the computers playing by themselves.

Bob - KC5DUI - EM26WE

Bob brings up some interesting points of discussion. It may be time for
us to run an actual study of just how far apart we all are, but think
we're all on 28.131+1500. Remember, being spread out is a good thing.
It's bad only if we don't know just how far apart we are. :o)

Hi the group,
since some days I have "officialy" presented and evangelized the BeacoNet
project to french amateur
"authorities" involved in VHF/Beacons Band Plan management across Europe.

Initial feedback is very positive and further meeting and discussions will
be planned in the coming weeks.

It seems that they appreciate the concept of Beaconet^31 and could
sponsored an "official" allocation in the
CW beacons sub-band in coordination with other european countries! The
dream in fact.
I have proposed doing that on 2m,70cm,23cm and up if possible.

Concerning Transatlantic system on 2m, it exists a "official" frequency
according to several band plans:
144.407
with 1kHz of "guard" up and down. We could probably use this one shared for
transatlantic experiments.

Currently I'm making the situation concerning the 2m beacon sub-band in
order to locate potential "holes",
where one could be proposed to be "officialy" dedicated to the coming
BeacoNet^31 european network I would
like to see up and running.

So, process in ongoing on my side, and for sure I will keep you informed.

Proposal from Ramon is very constructive and his experience of european
conditions and trafic could be a

very good advice and sure will provide us some good clues to find the best
mode and stations setup.
Following this idea, in order to reduce distance for initial experiments, a
FP station or one in Newfoudlands
could be worth in the project, beaming at high power towards EI stations
(approx 3100 kms).

Does PSK31 survive the Aurora phase distortion? That's a question and I
would like to know the answer too.
But one day I'm sure we will know ...

Thanks Bob.... Should I go QSY about 50 Hz up? Would that help, or will that
bring me outside the scan range of some of you out there?

The 2 meter bandplan can be found here:
http://www.darc.de/bandplan/pdf/2m.pdf

It's in German, but frequencies are frequencies :-)

Hi all
Today I wanted to run a receive only experiment between BEACONet and
BEACONet^31. It was a flop. I did receive a good many beacons (AX.25) from
K9ER. I plan to try again tomorrow. I have been working on a web site to show
what type of data BEACONet/^31 can (trying to help with the work load)
collect. Also I am working on "how to install a Solar Electric BEACONet
station" If any of you would like to see a detailed representation of what
your beacon did today here in South Carolina. Visit http://wd4rbx.tripod.com
 All comments and suggestions are welcome.

188. [propnet] Welcome KC4UMS; station changes

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Sat, 10 Nov 2001 22:09:54 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46244-2001.11.11-00.40.41--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

I also heard KC4UMS on a couple of occasions this afternoon, and even plotted his location, although I didn't get the call and the grid in the same transmission .....

I have finally got the 10m Hamstick installed on the aluminum roof, and this time it's about TWO meters from the vertical steel mast that holds up my VHF antennas, and THREE meters horizontally from the computer that makes all the noise. (The previous antenna, an Outbacker, was one meter from the mast and two meters from the computer.....) I am once again hearing stations, although mostly today KC5DUI and PA3EUG, but apparently I am still being heard in France.

W3NRG did hear my groundwave signal a few times. I'm going to leave the antenna where it is for a few days and see who hears me and vice versa. I may then try to put it on a mast with radials instead.

It was nice to see the report of our frequencies. The HTX-10 is an OK rig, but we have to guess at the last 500 Hz or so. Also, I had no idea DigiPan could scan .... thanks for pointing this out. I think more sophistication in the psk31srv scanning algorithm would help our cause a lot.   I often see it examining a bit of noise 50 Hz away from a huge PSK31 signal.

73

Dave

Hello from France Timothy,
fine copy here of your signal.
Now, since you had setup a preamble text it's really easier to "catch" your
beacon.
Welcome aboard.

Hi Tim,

welcome to the club!!

Thank you very much for your first report. We hope to see many more of
these, as you may have seen us send them.

A couple of tips:
-Add CRC to your beacon and move your email address to your PSK31Srv
preamble text. Or, alternatively, add a Status Text in UIView that you
transmit every once-in-a-while (15-30 minutes). Why? We are using the CRC on
receive to distinguish "correct" hits from "bad" hits. We used to get a lot
of garbled information in our station lists, which made it hard to figure
out how many station you actually had heard. As an added advantage, you
won't plot a station unless conditions are good enough to copy at least 25
characters (or so) flawlessly. In order for this to work, you should make
your preamble (in PSK31Srv setup or psk31srv.ini) long to allow stations
ample time to "lock on" to you. Your actual beacon text (in UIView) should
be short in order to lower the possibility of errors in the reception.

-Use UIMailer from Jeff Steinkamp, N7YG, to report your findings. You can
find it (free) at http://home.earthlink.net/~n7yg/uimailer.htm. It really
takes work out of your hands, and it provides us a standardized way of
getting the data. In general, if you send a report to the group, please
start the subject line with [CATCH]. Several of us have set up messaging
rules (e.g. in Outlook Express) to save reports automatically to a special
folder.

- A nice enhancer is F5SMZ's overlay file. It shows you exactly which
stations "could be active" and which stations are active. He has been
mailing them to this mailing list, you can either go to the list history at
tapr.org or I can email you a copy if you are interested.

Again, glad to see you as a new member of the BEACONet^31 club !! Keep the
reports coming...

73s,
--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Rendered body type: text/plain

Hi Guys,
I've been absent from 10-meters for a while to concentrate on 2-meter
activity...both the upcoming Leonids Meteors as well as getting a group
of folks ready for using BEACONet in non-digipeated simplex mode as a
VHF Contest Rover tracker. It looks like this may be just the ticket to
get some activity on the VHF bands on a more regular basis.

I thought I'd share this note that I recently shared with the Rochester
VHF Group's eMail remailer. It conserns activity on 147.585 MHz. I am
running a 4-element beam, pointing East from FN03 (between Rochester and
Buffalo NY).

Just fyi.

Ev, W2EV

207. [propnet] WOW...Automatically updated UI-View maps!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Mon, 12 Nov 2001 08:10:08 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46393-2001.11.12-07.38.53--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Ok...by now you've come to realize that the last link that I sent was a
joke.  This one, however, isn't!

Did you know that UI-View was written with a feature that checks the
date/time stamp on your map each minute?  If it has changed, then it
reloads the map.

<<pausing to allow the concept to sink in>>

If we could run an agent to periodically download a new map from an
Internet site of interest, we could use BEACONet data to overlay other
information!  For instance: imagine our HY-BEACONet icons plotting on a
map like this... http://www.ips.gov.au/asfc/current/usmap.html or (once
we establish a transatlantic VK-BEACONet system)...
http://www.globalserve.net/~hepburnw/tropo_nat.html

All it takes is:
o someone to identify an Internet-based map to use
o develop a valid .inf file for it
o find an agent to download it from time to time

Wow! (did I say that yet?) :o)
```

Rendered body type: text/plain

Hi Ev and all

I checked out my equipment for the up coming Meteor shower and found that the radio gear is fine on all bands but, My solar power battery bank is just to old to handle the load. The batteries were 2 years old when I got them, and I have had them for 5 years. I am going to try something and If it works Ill try to operate 223 MHz. If not I can monitor.

What really sucks is that I planned to replace them last fall but could not turn the funds loose for 6 T105 Golf cart batteries @ $62 each. I still think that Solar Electric rules!

Rich

Hi all,
this last week-end I have worked on a piece of soft in java, my LogViewer for BeacoNet (seems to work also for APRS traffic).
Well, have a look at this page
http://www.144800.com/beaconet/alfa_version.htm
it's tests from today and very encouraging.

I will work on it to enhance features if you like it.

73 de JP :)

211. [propnet] More info about the BeacoNet Java Log Viewer

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Mon, 12 Nov 2001 21:19:15 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46424-2001.11.12-14.52.09--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,
some few explanations about the java applet.

For those who had the opportunity to have a look at the link below
http://www.144800.com/beaconet/alfa_version.htm
have seen my applet.

Now I can see exactly each "hit" received during a day from a BeacoNet
station and that provide me a good overview of propagation behavior through
the day and also "shape" of the reception.

Each small black line in the timeframe show a hit.
For the template I had posted on the webpage today, I began to start logging
around noon, explaining why I have not been plotted myself before.

So you can see also my "TX profile". What you can notice today is that
PA3EUG is transmitting more often than me, and that I have a quite continous
reception of his signals, 5800kms.

In order to not garbage the report with "strange" callsigns I have checked
the Validate CRC option in PSK31srv setup; hence what you see are only full
and correct RX of stations received.

Behing the scene:
1) The first java program parse the log file of UI-view (e.g 20011112.txt).
Here is an extract:

```
2001-11-12 12:20:47 START UTC
2001-11-12 12:21:48 PA3EUG>HY0G04-15 <UI>:
[fn42ki]
2001-11-12 12:25:58 PA3EUG>HY0G04-15 <UI>:
[fn42ki]
2001-11-12 12:26:25 F5SMZ>HY0DA1-15,TCPIP* <UI>:
[JN39EJ]
2001-11-12 12:26:45 F5SMZ>HY0DA1-15 <UI>:
[JN39EJ]
2001-11-12 12:28:04 KC4UMS>HY0E02-15 <UI>:
[EM81fk]
2001-11-12 12:30:06 PA3EUG>HY0G04-15 <UI>:
[fn42ki]
2001-11-12 12:31:33 PA3EUG>HY0G04-15 <UI>:
>120500z-w1/pa3eug 70W/GP httu:// o.toÏACONet for info
2001-11-12 12:32:24 F5SMZ>HY0DA1-15,TCPIP* <UI>:
[JN39EJ]
2001-11-12 12:32:44 F5SMZ>HY0DA1-15 <UI>:
[JN39EJ] ...
```

Then it produce a .CSV file entitled for archiving or post-processing.
That's exactly what happen with the applet for display, but other usage are
possible.
Here is extract and truncated sample:

```
F5SMZ, 1004, 1010, 1016, 1022, 1028, 1034,
KC4UMS, 748, 753, 768,
KC5DUI, 1023, 1030, 1044, 1051, 1080, 937,
PA3EUG, 1007, 1011, 1019, 1028, 1032, 1036,
...
```

What you can see:
Each callsign is followed by a series of number :)
I made the assumption at the beginning - 1 day = 24 hours = 24x60mn, so
1440mn.
1440 is my timescale and 1mn my unit, so at noon we are at 720.
So you have all the time of RX for all stations here in the .CSV file.

2) In a second time the applet start to work. The applet read the .CSV file
and plot at the right X and Y a one pixel small black line, until...the end
of the callsign record, then until the last callsign of the file. Simple.
Few graphical enhancements and time conversions and it's done.

I think now that the concept work, is extract config code and locator and
add them to the display. I can help imagine this kind of RX report running
on 2m ... my dream start to be true. Even if I'm not at home I can see
exactly when an Es opening had occured. I will also focus on automating the
system and of course share it with my BeacoNet colleagues.

At last, but not least, if this small project goes gold, I will try to find
(with you) a proper name for it.
Hope you enjoyed reading me. Sorry to be long.

73 de JP, European BeacoNet enthusiast. :)

Subject: [propnet] More info about the BeacoNet Java Log Viewer

Hi all,
some few explanations about the java applet.

For those who had the opportunity to have a look at the link below
http://www.144800.com/beaconet/alfa_version.htm
have seen my applet.

Now I can see exactly each "hit" received during a day from a BeacoNet
station and that provide me a good overview of propagation behavior through
the day and also "shape" of the reception.

Each small black line in the timeframe show a hit.
For the template I had posted on the webpage today, I began to start logging
around noon, explaining why I have not been plotted myself before.

So you can see also my "TX profile". What you can notice today is that
PA3EUG is transmitting more often than me, and that I have a quite continous
reception of his signals, 5800kms.

In order to not garbage the report with "strange" callsigns I have checked
the Validate CRC option in PSK31srv setup; hence what you see are only full

and correct RX of stations received.

Behing the scene:
1) The first java program parse the log file of UI-view (e.g 20011112.txt).
Here is an extract:

2001-11-12 12:20:47 START UTC
2001-11-12 12:21:48 PA3EUG>HY0G04-15 <UI>:
[fn42ki]
2001-11-12 12:25:58 PA3EUG>HY0G04-15 <UI>:
[fn42ki]
2001-11-12 12:26:25 F5SMZ>HY0DA1-15,TCPIP* <UI>:
[JN39EJ]
2001-11-12 12:26:45 F5SMZ>HY0DA1-15 <UI>:
[JN39EJ]
2001-11-12 12:28:04 KC4UMS>HY0E02-15 <UI>:
[EM81fk]
2001-11-12 12:30:06 PA3EUG>HY0G04-15 <UI>:
[fn42ki]
2001-11-12 12:31:33 PA3EUG>HY0G04-15 <UI>:
>120500z-w1/pa3eug 70W/GP httu:// o.toÏACONet for info
2001-11-12 12:32:24 F5SMZ>HY0DA1-15,TCPIP* <UI>:
[JN39EJ]
2001-11-12 12:32:44 F5SMZ>HY0DA1-15 <UI>:
[JN39EJ] ...

Then it produce a .CSV file entitled for archiving or post-processing.
That's exactly what happen with the applet for display, but other usage are
possible.
Here is extract and truncated sample:

F5SMZ, 1004, 1010, 1016, 1022, 1028, 1034,
KC4UMS, 748, 753, 768,
KC5DUI, 1023, 1030, 1044, 1051, 1080, 937,
PA3EUG, 1007, 1011, 1019, 1028, 1032, 1036,
...

What you can see:
Each callsign is followed by a series of number :)
I made the assumption at the beginning - 1 day = 24 hours = 24x60mn, so
1440mn.
1440 is my timescale and 1mn my unit, so at noon we are at 720.
So you have all the time of RX for all stations here in the .CSV file.

2) In a second time the applet start to work. The applet read the .CSV file
and plot at the right X and Y a one pixel small black line, until...the end
of the callsign record, then until the last callsign of the file. Simple.
Few graphical enhancements and time conversions and it's done.

I think now that the concept work, is extract config code and locator and
add them to the display. I can help imagine this kind of RX report running
on 2m ... my dream start to be true. Even if I'm not at home I can see
exactly when an Es opening had occured. I will also focus on automating the
system and of course share it with my BeacoNet colleagues.

At last, but not least, if this small project goes gold, I will try to find
(with you) a proper name for it.
Hope you enjoyed reading me. Sorry to be long.

73 de JP, European BeacoNet enthusiast. :)

Error! Corrected. I was setting up for 6 meters when I realized that I could
not use my amp. I switched to ten (up|down band button) and forgot to change

the code. I cough it a couple hours later.

JP,
What a great web-based application! I am encouraged by what it appears
to do. Do you see this as an application that each person would run
individually or be a web-based host to which people could centrally send
their data for parsing and display?

Either way, well done!
Ev

227. [propnet] VK-BEACONet.25 in Western New York

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 13 Nov 2001 06:20:42 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46515-2001.11.13-05.49.55--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've gotten a couple of eMails wondering about my lack of presence on
10-meters lately. Not to worry..."I'll be back". :o) I'm directing
most of my energies to preparing for the Leonids and getting the local
crew active with "BEACONet Rovers" for the upcoming VHF Contest in
January.

To that end, I've been keeping a presence on VK-band (147.585 MHz). If
you live anywhere in the Rochester, Buffalo, Toronto, Syracuse area and
wish to lurk, please do so. There appears to be 4-stations gearing up
for Rover activity now, with more to come.

Why use BEACONet for this purpose, when the APRS network already does it
so well? Easy...for the purposes of a VHF contest, one must assure that
their station remains simplex and non-relayed to non-amateur services.

Since we use UI-View this task is easy. One simply removes any mention
of "HOPn-N" from their UNPROTO path and they won't be digipeated. One
simply includes "RFONLY" after their Configuration Code and UI-View (and
our future LIVExchange Server based on AHub) will ignore the packet and
it won't be passed-on to the Internet (a non-amateur means of
communication).

Just FYI.

Ev, W2EV

Looks like something is wrong here. My code has not changed from yesterday.
Is it possible that the program is storing it?

Rich

Can't wait for Jeff to get version 2 online so we can see what hours
different stations are received. I've set my system up using 1.73 so it
emails me at work every hour during the day and sends one to the list at
1800 and 2358Z (snapshots are every five minutes). Is interesting to look
at the hour by hour ones and get a general idea of when stations come and
go. Every evening I have KF6XA and W3NRG start out the new zulu day and
then fade out before 0100Z . They show back up the next morning around
1500Z and continue off and on throughout the day. Looking at the 2358Z
report one "could assume" I'd copied them all around the clock when there
was actually dead time during the night. This is FUN!!

I'm currently xmitting at 7 minute intervals during the day so the system
has a longer receive time.

Bob - KC5DUI

240. [propnet] Possible TransAtlantic Frequency Choices

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 14 Nov 2001 07:02:16 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46676-2001.11.14-06.31.43--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
According to the ARRL bandplan for the USA the three following sub-bands
seem to hold promise for this project:

 144.275-144.300 (Unattended CW Propagation Beacons)
 144.900-145.100 (Weak Signal and FM Simplex)
 145.500-145.800 (Miscellaneous and Experimental Modes)

In Europe (thanks to Ramon's link to the DL bandplan), the first
sub-band is heavily populated by SSB operations (so I am told...can
anyone verify).  The second is a "digital" sub-band and the third is a
NBFM sub-band.

Does anyone know if operation in these sub-bands is channelized by law
or simply by convention?  Is there a channel that is "less occupied"
than another?  I'm looking for some general information to use to narrow
the search for our "TransAtlantic home".
```

Hello...

In April 1998 Slovenia signed CEPT recommendations.
Check out the frequency, power chart for each licence class.

http://www.hamradio.si/freq98.html

I don't know how it is in other countries but this is what and where we can
work.

> According to the ARRL bandplan for the USA the three following sub-bands
> seem to hold promise for this project:
>
> 144.275-144.300 (Unattended CW Propagation Beacons)

This is the SSB DX band. Actually, 144.300 is the SSB calling frequency, and during any type of condx you will find plenty of traffic in all of this band.

> 144.900-145.100 (Weak Signal and FM Simplex)
144.900-145.000 used to be the beacon band, but as I understand, since IARU-R1 Tel Aviv '96, no longer. 145.000-145.100 is used for FM repeater input using a 12.5 kHz grid.
> 145.500-145.800 (Miscellaneous and Experimental Modes)
145.500-145.5875 is used for simplex FM. This is well-used, especially in times of good condx. 145.600-145.7875 are FM repeater outputs. Not something you want to use either.

At least in The Netherlands (and my experience says... the rest of Europe is more or less the same), there is no LAW forcing you to a grid frequency or to restricting you from any more operations anywhere. Unmanned beacons, however, would probably need a special exemption and that may be refused if you don't stay in the bandplan. FM operations (both simplex and repeaters) generally stick very well to the 12.5 kHz grids, with the 145.x00, .x25, .x50, and .x75 channels traditionally heavier used than the "odd" channels.

Generally, the HAM population density of Europe is higher than in the US, which makes the 2-mts band better used than in the US. I would steer clear of any FM assigned frequencies. What about using 144.400-144.490 subband (IARU-R1 beacon band, except for in Netherlands it looks like)? The US bandplan shows this for "new OSCAR" operations, I haven't heard of any OSCARs transmitting there and it would absolutely throw off the bandplans outside the US to use OSCAR here. After all, we are talking about a time-limited experiment (a couple of months at a time)...

Thanks,

--Ramon

247. [propnet] Could this be BEACONet^31 future software?

From: RickfordG@aol.com
Date: Wed, 14 Nov 2001 17:39:13 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46721-2001.11.14-17.06.21--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

W1SQLPSK

Hi all

As Ev has recommended a while back we should look for potential BEACONet software.

Bob is evaluating Digipan latest version and I just found a program that "so to speak" blew my skirt up. Right now I cant see how this software could be used to capture our beacons unless you want to sit in the shack 24/7 but, With some modification it would blow "Winworbeler" out of the water and into orbit. As with most PSK software it is under development and the modifications come from the majority of user requests. Las I heard there are over 200 on the [propnet] [beaconet] list. Remenber, our voice (in my opinion) in the APRS world is like a whisper.

Rather then repeat their write up Ill just hit the high spots.

a) Minimal PC requirements.

b) Able to simultaneously receive 20 channels with the potential for 50. Hummm..

c) Built in data base and much more. Jeff I think that you will like that feature ;-)

Did I mention it is free? All you have to do is register with them.

I think we relay need to have a better look at this software and if the group thinks this is our future, With over 200 members we should have a voice that the developers could hear!

Also if you decide to download it, it might be a good idea to mention BEACONet in the comment box.

Here is the URL http://www.faria.net/w1sql/

    145.55555555555555555556666666666666666666677777777777777777778
        00112233445566778899001122334455667788990011223344556677889900
        05050505050505050505050505050505050505050505050505050505050050
W/K/N   | ----------Miscellaneous and Experimental Modes------------|
S51     < --NBFM Simplex-- | ----- Repeater Outputs ---------------|
DL      < - NBFM Simplex -| ------ Repeater Outputs --------------|

There appears to be an interesting "sliver" of frequency that we may be
able to concentrate on : the area between "NBFM Simplex" and "Repeater
Outputs".  Another possibility may be just below the ISS frequency of
145.800 MHz and above the Repeater Outputs.  I'd want to ask more input
on that from other sources, though..

Don't forget:
o we need only about 1-kHz of space
o antennas will be pointed *away* from most activity as we
  will be pointing into the ocean.  This experiment favors those
  with ocean views
o this particular segment would encourage activity by east coast
  USA stations who would typically not be interested, as it is
  sufficiently seperated from their normal SSB/CW operation, but
  their antennas (BIG ones) will still tune fairly well

It's time to play!

The Leonids may peak on the 18th. Activity will begin on the 16th
overnight (at least by me).

Join us on Meteor Mode!
Register your intent on http://go.to/METEORegistry
Tune to 147.585 FM (anyone want to try on 223.78?).

More information in APRSdos's METEOR.TXT help file
(http://www.dididahdahdidit.com/text/meteor.txt) and on the BEACONet
website (htp://go.to/BEACONet).

Ev, W2EV

Hi Ev,

Remember that there is siginificant packet activity in the 145.51 to 145.75
range, at least in western New York. Several nodes are located there
including 145.53 .61 .67 among others. I believe that .55 is free.
This may not be a concern elsewhere, though.

Jack

By the way, with "digital modes", they generally mean AFSK (FM) packet radio signals in Europe... JP, do you know what they actually use this band for in Europe?

Hi Rich

I have been watching the band between us and it looks like any catches between us during the shower should be a rock. I will be running 80 watts to a 6 element beam pointed at you.

Rich

Note that last time I checked there were still a few FM repeaters with output
on 145.800 left. They were supposed to move, but there was some local
resistance against it. Let me check my "informed" sources on this one and
report back...

Actually, 145.000 to 145.800 used to be seen as a big, continuous FM band that
is used both for simplex (145.2125-145.5875) and for FM repeaters
(145.000-145.200 input, 145.600-145.800 output). With the disappearance of the
145.200/800 repeaters because of "overflow" of the repeater output into the
satellite band, 145.200 has been absorbed "naturally" for use in FM.

Actually, 145.799 may not be such a bad choice but I suspect that we will get
regular interference there from European stations.

As for antennas... next time I'm in Europe, I should try to get my hands on a
second-hand 16 elements TONNA (F9FT) long yagi... That's for me THE antenna of
choice :-). High gain, sturdy, etc. JP must know them...

Hi all,
I have submitted the BeacoNet 2m project to french IARU 1 manager. A
meeting is planned the 24 Nov 2001. After, I will have more info for
allocating a frequency as I requested.
For me the best place is in the beacon sub-band 144.400-144.500.
For 144.800 to 145.000, plenty of packet all 12.5kHz... not a good place.

For Ramon, I have a 17 elmts Tonna ready to "strike" on 2m!

I am not sure yet what I will be doing with VHF. All this equipment runs off
of my solar power. If I can TX VHF and Ev wants to try 223 that where my TX
will be. I might try to monitor 2 meters. I do have a plan that will allow me
to keep charging the batteries at night if it works out I could be TXing on
147 and 223. If I can get 147 going it will be 13 elements and 90 watts.

Keeping fingers crossed

Rich

271. [propnet] Plugging BEACONet, dropped NASA a line today

From: RickfordG@aol.com
Date: Thu, 15 Nov 2001 16:46:28 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46889-2001.11.15-16.13.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All
I received NASA's news letter, and today the article that talked about
Scientists from around the world that are going to try and find out which
computer models are most accurate in predicting the Leonids. They are
actually going to stay up all night and count rocks :-(Here is the letter
that I sent them offering our help.

Dear Dr. Phillips,

I was wondering if your group would be interested in some help with pin
pointing the peek of the Leonids Meteor shower?

I belong to an elite group of Ham radio operators that study radio wave
propagation. During the Leonides Meteor shower we will be trying to bounce
our radio signals off of the ionized meteor trails. Our system is fully
automated and capable of gathering useful data around the clock.

Rendered body type: text/plain

Well...I guess we better get active, huh? :o)
Who's "registered" for 2-meter (147.585-MHz) operation so far?
http://w9if.net/iweb/gifs.std/US_BeaconNetMapOut0

It may be a good idea to have KD7TA and N7HXP point in each other's
direction as activity in the west seems a bit light on 2-meters. Then
again...I'll be pointing at KD7TA during the overnight of the 17th to
see if my NY signal can make it all the way to Wyoming.

The fun will begin tonight! I will power-up at 11:00 pm and run through
11:00 am (or until the neighbors complain) and do it again tomorrow
night and the night after.

Join us!

Roger changed the logfile datestamp format in a recent version of
UI-View. I can't remember on what version that change took place. You
may want to refer to release notes as this may impact the work you are
doing, JP.

Hello Jack,
If the KH6 to California path is any example, the TransAtlantic
Experiment is really only applicable to stations that are line-of-site
to the ocean. There is no real possiblity of glory for us in Western
New York as a part of this experiment, I'm afraid.

You bring up a good point, though...one that I've failed to mention:
I'm not looking for an international 2-meter BEACONet^31 or .25
frequency. I'm looking for a frequency that is commonly usable by
stations who are Line-of-Site to the Atlantic Ocean...knowing that their
beam antennas will be pointing *into* the ocean and *away* from activity
on their continent.

As such, finding a frequency that is "shared" for other purposes isn't
out of the question, really. All we need is a 500-hz "sliver", tucked
between other established channels, or between established sub-bands.

Ev, W2EV

This is good news! Let's talk about finding a commonly usable
frequency, though, rather than what is better for one continent. See my
note to Jack, earlier. Well done, JP! :o)

283. [propnet] 223.780 MHz & Leonids.

From: RickfordG@aol.com
Date: Fri, 16 Nov 2001 09:09:54 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46974-2001.11.16-08.36.54--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

If anyone is interested In trying 223.780 let me know. I am not sure how much
TXing Ill be able to do but I will monitor 24/7 easily. My time table is to
be up and running some time Saturday morning and with some luck (I have a
plan) I should be able to TX all I want.

Rich

284. [propnet] conference call for brainstorming on 2 mts transatlantic efforts

From: "Ramon F. Kolb" <ramon@ieee.org>
Date: Fri, 16 Nov 2001 09:36:54 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-46977-2001.11.16-09.05.23--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

We have been talking for a while about setting up one or more 2 meter
stations to attempt transatlantic propagation. There are still a lot of open
issues, among which:
* when?
* which stations? Can we do it from home, or do we want some dedicated
stations in Ireland and/or Newfoundland?
* how?
* what are those famous Brendan Trophies?
* which mode?

* which frequency?
* Etc.

Therefore, I want to organize a conference call to discuss these issues. The best date for this would be THIS SATURDAY Nov. 17, at 9 or 10 AM EST, which corresponds to 15:00 or 16:00 MET / 14:00 or 15:00 GMT. It would be good if several of you can attend, including some from Europe.

For the US, I will set up a tollfree number. For abroad, I am trying to see what I can do...

If you are interested, please let me know your TIME PREFERENCE. If you are interested but absolutely CANNOT attend at this time, please let me know as well. I know it coincides with the Leonids MS Event, but next weekend is Thanksgiving Weekend in the US, and the week after my company will have massive layoffs so I am not sure I will have access to the bridge anymore at that time. (Let's hope for the best but plan for the worst :-)).

Thanks a lot, please let me know ASAP.

I thought I'd pass this note along from another list serve that I belon
to. The writer is asking for people who are experiencing 6-meter DX to
post the time of day that they are experiencing openings so that they
can get a better idea of when the band opens.

<I'm chuckling now>

This is the same group of folks who, a couple of years ago, made fun of
the idea of using BEACONet.

Ironic, isn't it? :o)

Ev, W2EV

ps...I can hardly wait for all of the wrinkles to be worked out of
Jeff's UI-Mailer v2.0. What a quantum leap for us.

Hello All,

If you think about it, the reports today at W3NRG bracket
the lower 48 states. We have K7IP (for the first time) at
the northwest corner, W3NRG holds down the southwest
corner, N2VRJ is on station at the southeast and PA3EUG
is up there in the northeast.

That is not to in anyway ignore the good guys "holding down
the landscape in the middle!"

73

It's too bad this is still in beta at this time. Such data would
absolutly allow us to pinpoint the peak of the Leonids, by location
across the continent. The implication is staggering.

Does anyone else realize just how powerful of a tool we have in the
BEACONet combination of UI-View and UI-Mailer? Astounding!

Ev, W2EV

Wow. Now THIS is a very cool product. I'll have to download and see if
the author would be willing to port the product into being a "web
server" like PSK31 is. The problem is...I don't know how to describe
how to do that, if the author themselves doesn't know how.

I'll cross that bridge if I need to, I guess.

Ev

Rich,
I'm *in* for 223.78 tomorrow night (not tonight).  I've got to recheck
my antenna feedline before I put 200 watts to it. :o)  Can I count your
being there?

If/when we're successful, it will represent the highest frequency ever
attained for packet-based meteor communication in the amateur service.
Right now...that record applies to our work on 147.585!

Sure enough! According to T-Marc's website...
147.585 147.585 VA Woodbridge W4IY AT100.0

It looks like a simplex repeater on a simplex frequency. :o(
Fortunately W4IY is a well-known SSB contest group. Let's see if they'd
be interested in a QSY once their competition starts using BEACONet to
track contest rovers on this frequency. :o)

Sorry Bob. At lease lurk, if you can.

What a horrible frequency to pick from day 1...our 147 machine in Dartmouth,
MA get's whack all the time...although it's a good indicator when the band
is hot :-) It sure get's folks peod!

I am going to place the beta version on the web site this evening with a
quick readme file for those who want to play with it. I have had this
running continuously for the past 3 days and there had been no problems.
Will be interesting to see what happen with the meteor shower later this
weekend.

The link will be http://home.earthlink.net/~n7yg/mailer2.zip

It's too bad this is still in beta at this time. Such data would
absolutly allow us to pinpoint the peak of the Leonids, by location
across the continent. The implication is staggering.

Does anyone else realize just how powerful of a tool we have in the
BEACONet combination of UI-View and UI-Mailer? Astounding!

Tim,
I'm not sure which frequency you're talking about...but *both* of these
(147.585 and 223.78) are in the simplex portions of the band. There is
no indication that there should have been any repeaters to deal with.

What is the name of the frequency coordination body for Dartmouth?

Well, I just discovered, my great big, huge, brand new television get's tore
up real bad on 2 meters. I guess with the 2 meter vertical only a few feet
above the TV antenna (yes some of us refuse to buy cable), accounts for
that. So as to remain in marital bliss, operation on 2 meters will not be
possible until I come up with another antenna installation. Won't happen
this weekend.

Therefore I will be on 10 meters for the remainder of the meteor showers
unless someone thinks 6 meters will be a better bet. I can push 100 watts
on 6 meters to the vertical.

Jeff,
Consider using a simple appliance timer powering your TNC (unless you're
using AGWPE, of course). This works for me.

Otherwise, 6-meters looks like a pretty good second choice! The
METEORegistration page shows some good opportunities for you:
http://w9if.net/iweb/gifs.std/US_BeaconNetMapOut8

Jeff

6 meters would be great with a vertical and 100 watts. I was heard last year
and I was running a Jpole at 30 feet and anywhere where from less than a watt
to 14 watts. My 6 meter rig is jazz up and most of the time I get less than
an out.

There's been a repeater on 147.000/147.600 for more than 25 years there.
I'm well aware of the bandplan but when you combine over-deviated ax25,
power and band openings it only results in trouble when 2 or more of the
above elements converge. I hear stories of gallons being run there...some
prop test that is!

This network could have seamlessly fit into one of the existing
(underutilized) packet bandplan "channels"...picking 585 was just plain a
dumb idea...

Subject: [propnet] Repeaters on BEACONet frequencies

Tim,
I'm not sure which frequency you're talking about...but *both* of these
(147.585 and 223.78) are in the simplex portions of the band. There is
no indication that there should have been any repeaters to deal with.

What is the name of the frequency coordination body for Dartmouth?
Ev

OK

After a few problems, The beta version is now onthe web site at

The link will be http://home.earthlink.net/~n7yg/mailer2.zip

this link will download directly. I also provided a link on the normal web page.

Have fun and give me feedback. Ed, I found the problem with the gridsquare and fix'd it. Not sure why I did that, but I assume if there is another problem I will remember why. HI Hi

BTW is the 6 meter freq 53.53 and is it SSB or FM????

> prop test that is!

Over deviation of any signal (ax.25) is a bad thing for sure, but let's
find a way to be good neighbors. For instance...how have you assured
that *your* BEACONet signal on 147.585 MHz doesn't over-deviate and
become a source of problems for the repeater that you mention? Elmer
us.

Of course, "band openings" will cause qrm to any voice repeater...but
that is true of what other repeaters on 147.000/.600 will do. You

certainly aren't suggesting that the 25-year repeater be granted
clear-channel status. :o) This "reason" to support a QSY of BEACONet
operation seems ill-conceived at best.

As for "gallons" of power? If "gallons" means kilowatts (as it is
referred to by most of the folks in the hobby), it seems like an
overstatement. ;-) The METEORegistry page lists only 2 people in the
250-499 watt range...neither of which is within LOS of MA.

All of this is leading me to believe that the owner of the repeater may
wish to take a closer look at their RX equipment to assure it is as
tight as it could be (a story rarely has one side to consider, after
all).

So...Elmer us. How can we be assured that our deviation is set
appropriately to be good neighbors to the repeater in MA? How did you
set yours?

Ev, W2EV

I lurk only for that reason...you won't find me transmitting there. Picking
a frequency crammed up against one of the most popular repeater inputs in
the country...good one.

The other freqs are great...no problem at all...you never hear complaints.

I've been privately accused of being "nasty" about posting my opinion....it
is just that...an opinion.

Tim
One's opinion is never considered nasty. I do have some difficulty with the argument about the co-existence of a BeacoNet transmitter on 147.585 and a repeater on 147.000/147.600. This original discussion started with this particular repeater pair in CT. According to the ARRL band plan and the different repeater coordination groups around the US, The whole eastern portion of the US has adapted a 15 kHz band plan. Last time I plugged in 147.600 and 147.585 into my bazillion dollar graphic calculator I get 15 kHz.

So tell me the difference between an AX25 signal on 147.585 and the users of the 147.015/147.615 repeater in Elmira NY or the handful of other coordinated repeaters on this repeater pair when the band opens.

It would seem to me if the repeater is plagued with interference when the band opens, then the repeater committee would do like the rest of the repeater owners across the us do and install a simple CTCSS access to eliminate the co channel interference.

Now on the other hand, checking the ARRL repeater directory I have (2001/2002) on page 42, the band plan indicates simplex operation between 147.42 - 147.57, This would indicate protection for the western portion of the US which is on a 20 kHz repeater spacing.

Therefore, in my opinion, is would seem logical to move 2 meter beconet operation to a different frequency. I would recommend something between 145.50 and 145.8. 145.585 might be a good choice.

Rendered body type: text/plain

>>>Last time I plugged in
147.600 and 147.585 into my bazillion dollar graphic calculator I get 15
kHz.<<<

In a perfect world...low power and no overdeviation, I'll buy that.

>>>So tell me the difference between an AX25 signal on 147.585 and the users
of
the 147.015/147.615 repeater in Elmira NY or the handful of other
coordinated repeaters on this repeater pair when the band opens.<<<

Where did ya get that one? I only brought up 147.600. But if they are
complaining, then the problem is worse than originally thought :-)

>>>It would seem to me if the repeater is plagued with interference when the
band opens, then the repeater committee would do like the rest of the
repeater owners across the us do and install a simple CTCSS access to
eliminate the co channel interference.<<<

Nice try....the solution is not to cover it up or filter it with tone
access. If you're getting into the bandpass of the repeater, you're
contributing to the reduction in sensitivity for their fringe coverage. I
liked the "good neighbor" and self-policing ideas better...

>>>Now on the other hand, checking the ARRL repeater directory I have
(2001/2002) on page 42, the band plan indicates simplex operation between
147.42 - 147.57, This would indicate protection for the western portion of
the US which is on a 20 kHz repeater spacing.<<<

Yes...go on...waiting for the point..

<<<Therefore, in my opinion, is would seem logical to move 2 meter beconet
operation to a different frequency. I would recommend something between
145.50 and 145.8. 145.585 might be a good choice.>>>

Bingo! Sounds good to me but I would be a hypocrit to think that the
satellite guys wouldn't jump all over to that proposal. Good try though.

What about good old 144.39. Seems that APRS and propnet have so much in
common as far as apps. Ok...I left myself open for that one...I'm wearing
asbestos shorts...

So...
o you don't operate BEACONet on 2-meters
  - so you have no first-hand knowledge of how the system actually
    interacts with a repeater system on 147.600 input
o you accuse BEACONet of being a major source for QRM to a repeater
  in MA (even though there is *no* known 2-meter activity within LOS)
o you say BEACONet QRM's because of overdeviated packet modulation
  - yet, you offer no assistance to elmer anyone
o you say BEACONet QRM's because operators run "gallons" of power
  - but can't substantiate any station that does
o you blame the QRM on band openings (which is a problem caused by
  other repeaters on the same frequency as the repeater you have

such an interest in...not because of BEACONet)

Tim Smith (N1BTQ) said:
> I've been privately accused of being "nasty" about posting
> my opinion....

If you want people to share your opinion, then offer well thought-out solutions when your opinions differ. But be sure to ask enought questions so you fully understand the interests of BEACONet. For instance...do you know why 147.585 MHz was chosen as a starting-point for 2-meter BEACONet operation? Do you care?

This board exists for experimental collaboration (not unlike your past association with the near-space group or your 6-meter ssb operation). This listserve does not exist to post useless rhetoric (opinions or not). Share your *solutions*, please. We are more open to flexibility than almost any other group of Amateur radio operators that you can find. How can you help the project, *and* meet your personal interests, too?

Ev, W2EV

336. [propnet] RE: Repeaters on BEACONet frequencies

```
From: "Tim Smith" <n1btq@ne.mediaone.net>
Date: Sat, 17 Nov 2001 19:15:08 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47217-2001.11.17-18.42.37--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

>>>So...
o you don't operate BEACONet on 2-meters
  - so you have no first-hand knowledge of how the system actually
```

interacts with a repeater system on 147.600 input

Ev...I was one of the first participants...go back and look at the threads. I contributed ideas, met skeds and participated as a QRP station...you have I had "several" healthy and thought provoking conversations back when there was was only a mere handful of participants on and no one to listen to. How quickly we forget...

>>>o you accuse BEACONet of being a major source for QRM to a repeater in MA (even though there is *no* known 2-meter activity within LOS)

I travel frequently...mainly up and own the east coast. It's not just in MA. When's the last time you put a receiver on .600 with a sound recording app line Scanner Recorder? I never implied that it was constant...just when the right combo or power, openings and overdeviation occur. You haven't listened there for any length of time because you're beaconing there.

>>o you say BEACONet QRM's because of overdeviated packet modulation - yet, you offer no assistance to elmer anyone

I tipped of the offenders...but they got their feelings hurt. It's hard to elmer someone that has made their mind up on an issue and will defend it at any cost, right or wrong.

>>>o you say BEACONet QRM's because operators run "gallons" of power - but can't substantiate any station that does

Go back and read the threads of your own group...I didn't say it...

>>>o you blame the QRM on band openings (which is a problem caused by other repeaters on the same frequency as the repeater you have such an interest in...not because of BEACONet)

Oh brother...even you missed the point...

Tim Smith (N1BTQ) said:
> I've been privately accused of being "nasty" about posting
> my opinion....

If you want people to share your opinion, then offer well thought-out solutions when your opinions differ. But be sure to ask enought questions so you fully understand the interests of BEACONet.

I fully understand what BEACONet or as some refer to as QRMNet.

>>>For instance...do you know why 147.585 MHz was chosen as a starting-point for 2-meter BEACONet operation? Do you care?

Besides QRM potenial to the repeater subband? Humor me...

>>>This board exists for experimental collaboration (not unlike your past association with the near-space group or your 6-meter ssb operation).

What that got to do with the price of eggs in Holley?

>>>This listserve does not exist to post useless rhetoric (opinions or not). Share your *solutions*, please. We are more open to flexibility than almost any other group of Amateur radio operators that you can find. How can you help the project, *and* meet your personal interests, too?

I agree..and it shouldn't. But it's a sign of not wanting to debate the valid aspects of the argument by discarding it as "useless rhetoric". You fail to meet controversy in the middle by even briefly playing devils advocate. I think you're a little guilty of playing the "rhetoric card" in your post, Ev.

Now just becasue I don't share your vision of appropriate frequency assignment it doesn't mean that I am disrespectful of what BEACONet is all about, how far it's come and how much potential it has to grow. Not only has this technology proven itself as an interesting fad to most, it does have very useful purposes. It's fun to go back and look at reception reports and coorelate them to solar history and past openings. With a little more AI and interaction to solar forecasts, weather forecasts, broadcast DX sig strength, and tons or related data the BEACONet system (I envision) will have far more capabilities that what is considered a "richly"

featured system today.

I think your wording above explains a lot. You've been accused of being "nasty" about posting your opinion. NOT that you HAVE an opinion, but the way you put it --

At 10:29 PM 11/16/2001 -0500, Tim Smith wrote:
>This network could have seamlessly fit into one of the existing
>(underutilized) packet bandplan "channels"...picking 585 was just plain a
>dumb idea...

Now my memory isn't what it once was, but I seem to recall that 585 was picked because there isn't any repeater there. I'm sure you could have said something other than "dumb idea" to indicate your displeasure with the frequency.

OK! Now that the argument is over -- let's find a SOLUTION.

Tim,
Let's try this one more time...

You started this thread by stating that BEACONet operation QRM's a
147.000/.600 repeater in Mass.

You then later clarified by saying that it happens only under the right
combination of factors.

Were you aiming for something specific or simply making a general
statement?  I'm trying to understand, but I seem to keep missing your
point.  Please try to do so without slinging mud or calling names.

Once was enough. It's not worth the energy and there doesn't seem to be
even the slightest tolerance for debating the issue.

Have fun....my opinion stands...I'll just tighten my "squelch" and move on.

Good luck,

Tim

Message-ID: <LYR1548-47252-2001.11.17-23.52.30--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I am preparing a 28 Mhz Packet beacon but find it difficult
to determine to correct Center Frequency.

The site www.rochesterny.org/beaconet/ only mentions
28.128 USB. This appears to be a read-out frequency.

Seeing the reflector is TAPR sponsored, would it be fair
to assume the TAPR standard of a 1600/1800 Hz tone pair
has been used and the CF is 28126.30 kHz?

73, Joost, ZS5S

Beaming west at 0745Z on 147.585 MHz from Alabama. Several
nice bright streaks have filled the sky while I was outside moments
ago. Most of the bright ones were headed in the West, Southwest,
and Northwest directions. They were really nice bright streaks.

73's,

Tim - N8DEU
Huntsville, Alabama

Hi Joss,
fine if you can find some time to work with us in BeacoNet project.
In the meantime, can you lurk 28.131 PSK and give some reports ? :)

Hi all

Got out of bed at 4 AM this morning hoping for a good sky show. I have to say
that the hour and a half I spent out in the yard looking up was spectacular.
The action was non stop. I did not see any fire balls or hear any whistlers
but the number of meteors was unreal. I wanted to run in and check the
computers but I was glued to my seat. I kept thinking "Man those computer
screens must be full of catches." Fog rolled in off the lake about 5:30 so
the daughter and I decided it was time to check the computers. Guess what!
0, ZIP, ZILCH, I could not believe my eyes! The rocks were falling 2,3,4
(that I could see) at one time. They were falling one right behind the other
and I got nothing! I am completely shocked and bewildered! The only thing on
28.128, 223.780 was my icon. Only calls on 2 meters were local.

Think Ill go back to bed

Rich

Rendered body type: text/plain

I just loaded WindowsXP. It's a "virgin installation", with nothing but
the operating system and UI-View 2.38 and PSK31srv 1.08 loaded.
Computer is a 1-GHz Athlon (that worked fine under Windows98se).

Note: this is a fresh load...not and upgrade. I FIDISKed, reformatted
the hard drive to NTFS and installed WindowsXP.

Two interesting symptoms (and a bad time for both):
o Meteor mode "stops working". I awoke this morning and no TX.
  This, even though it was working last evening, when I invoked it.
o Meteor mode (when it *did* TX last night when I went to bed)
  delays 20-seconds behind the system clock. I'm setup to start
  TXing at 0-seconds, for 15-seconds. It doesn't start until 20-
  seconds (though it does last for 15-seconds). My system
  clock is WWV-correct.

I will do more troubleshooting, but would like to know if anyone else
has experienced any similar problems. Frustrating, given the Leonids
peak earlier this morning. :o(

Ev

Rendered body type: text/plain

Hello Joost!
I'll answer your question in an indirect way...
There are three factors that come to consideration, when understanding
the way that BEACONet identifies it's frequency of usage:

o different packet TNC manufacturers could use different modem
  chips with different tone-frequencies ("old" Kantronics vs.
  "new" Kantronics vs. PK232, etc.)
o 1200-baud packet is quite forgiving as far as tuning criticality
o BEACONet is built on the principle that it should be "plug-and-
  play", since it is entirely possible for propagation to be non-
  existant for days at a time, yet important for everyone to be

able to tune to a mutually decodable frequency

All three of these factors combined have caused us to advertise the
transceiver frequency and sideband, rather than the TNC's center
frequency. So...give it a go...tune 28.128.0 USB and see if things work
just that way. If your station requires more detail than that in order
to decode (or if no one posts a "heard report" on your signal), then let
us know so we can modify things a bit.

Welcome aboard!
Ev, W2EV

Hi Earl,

I like to include an SSID after my callsign indicating which band I'll be on: -2, -6, -10. This makes it
 easy to register for the band of choice (although I don't participate on 223, that might be -12)

Rich

Subject: [propnet] Also on two...

The MS registry page only allows ONE registration -- so let me just say, I
am also running about 60 watts on 2 meters, even though my entry only shows 6.

SOMEBODY POINT OUT THIS-A-WAY!!! <G>

Yes,
I also noticed that signal from time to time.

Oops! I didn't think to do that, although that's what I've done
in the past!

Thanks,
Earl

> > seconds (though it does last for 15-seconds). My system
> > clock is WWV-correct.

My testing method included opening the system clock and displaying it on
the screen, and watching my TNC's TX/RX cycle. There is a 41-second
delay between when UI-View is set to start (0-seconds after the minute)
and when the TNC/Transceiver go into transmit. I am using a digiboard
Com3: and COm4: with UI-View on Com4:. The length of the burst is
correct, though.

As for this suggestion...
> Also, check that you haven't
> got any power saving options enabled that could "turn off" the COM port.

That crossed my mind just after sending out the note. I went into power
management, and selected "Always On", and restarted Meteor Mode (by
unchecking it, and re-checking it...it started up as expected). I'll
advise as to the result by the end of the day (but "so far, so good").

Thank you for taking the time to reply, Roger. Again, I'll advise again

later.

Ev

Ok...well, I tried to understand. :-/ For what it's worth, I asked a
station 7.1 km away from me to run meteor mode on 147.585 MHz (using the
setup instructions on the BEACONet web site), transmitting with very
high power (400-watts). When I tune to 147.600 MHz I hear nothing from
that station. I turn on my 20-dB preamp and I still hear nothing from
him. I am running an FT-736R transceiver (not a very good front-end for
strong signals).

My opinion is that the 147.600 repeater in MA should have someone take a
closer look at its front end. It's tough to blame the rain, if one has
a leaky roof. Of course, that's *my* opinion. :o)

73 & QRT on this thread,

368. [propnet] Problem Solved... [was:UI-View Meteor Mode Failure?]

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sun, 18 Nov 2001 11:19:16 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Cc: BEACONet/PropNET eMail Remailer <propnet@lists.tapr.org>
Message-ID: <LYR1548-47398-2001.11.18-10.48.45--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Bottom line: both issues now work. If one cares to read through the process, read on. If not...then please know how appreciative I am of Roger's patience when the problem is a screw loose in front of the keyboard. :o)

Ev, W2EV

> >> >o Meteor mode "stops working".

Having checked the system's power saver function, I've now checked "Never Off" and this no longer seems to be a problem. Thanks for the insight on this one, Roger. This is my first attempt at the NT/2000/XP world.

> >> >o Meteor mode (when it *did* TX last night when I went to bed)
> >> > delays 41-seconds behind the system clock.

UI-View shows the "correct time", as it should be transmitted. I am setup to TX at 0-seconds after the minute, for 15 seconds. The time-stamp in the Terminal Window shows HH:MM:00. However, the transmission doesn't actually take place until HH:MM:41.

> What's a digiboard? Is it supported in WinXP? Have you tried a normal
> COM port?

A Ditiboard is a 2-port PCI serial board. It was found and setup by WindowsXP during installation OK. Never the less, I switched my TNC to Com1: with the same results. Then...I had an epiphany. :o)

THE SOLUTION: Remembering that I'm using a 16-bit program in a 32-bit environment. I'd conditioned myself to think that changes made to an NT/W2k/XP system occured dynamically. In the 95/98 world, I'd conditioned myself to think, "If it does not compute, you must reboot". When I realized that I was trying to marry the two worlds together, I thought I'd reboot and see what happens. I did. It now works correctly without regard as to the Com: port I use.

Hi Tim,
<chuckling> no big deal, believe me. It's good to have you participating. I'll be back on HY-BEACONet by mid-week myself. I'm still scratching my head over why we've not had the kind of success we've had in the past on the Leonids (and I mean we had catches when the SSB/CW boys were complaining that there wasn't much to receive).

Ev, W2EV

370. [propnet] What gives???

From: Earl Needham <needhame@yucca.net>
Date: Sun, 18 Nov 2001 09:44:45 -0700
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47401-2001.11.18-11.13.20--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Geez.  Such a big build-up, for (hopefully) thousands of meteors per hour
and -- I never heard a thing!

        I guess nobody heard me, either.  Drat!

        Earl

Report from KE6AJE, mid west coast Ca. {CM78XH]

Finally after two years of no success with this experiment (Leonids) I printed a station via meteor scatter. Stayed up to observe the sky and the station during the event. Saw a good number of fast streaks, none to bright, (city lights don't help) running east to west mostly.
Had the antenna pointed to the east, (90) with nothing printing, then, @ !:44 AM I changed to North (-12) and immediately printed N7HXP. I copied 5 lines of his transmission.
I had my 6 meter AX.25 station up also, but in all the excitement of preparing for 144 MHz, I forgot to put the 6 mtr rig into "Meteor Mode". Sorry. No stations copied. I don't know if many people operating that band/mode. Anyway practice (might) makes perfect they say! I'll keep at it. Fun! Fun! Fun!

```

Rendered body type: text/plain

Just recorded N5RFX on 28.131; EM12JG.

Others may have recorded him already but
this is a first "pick up" of his call for W3NRG.

Ed

379. [propnet] Problem with Mailer 2.0 beta

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sun, 18 Nov 2001 16:05:05 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47430-2001.11.18-14.04.15--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Discovered a problem with the mailer when we are keyed up in meteor mode.
As I only figured would get maybe 12 - 15 catches an hour, I did not figure
on the 695 I got from Rich this morning. Running 695 through my conversion
routine yields some interesting results as evident from my last catch
report. As this will not be a problem after today, I am not going to rush
and fix it. Rather, I need a few suggestion on how to handle this during
meteor mode.

As for the Meteor showers, I arrived home from work about 0130 local time
(0830Z) and to be perfectly honest, I did look for some evidence of meteor
activity and I did not see any compared with the previous years. I took a
look at UiView and I saw absolutely nothing on the screen. I was only up on
28.128 due to interference problems on 6 and 2 meters.

Wow, JP, excellent work! It would be interesting to find out what your
plans are for this system. Is it automatic or manually updated at this
time? Can it be made to use data from Jeff's UI-Mailer to generate a
report, too?

Tell us more, please.

Copy the full reception to us, would you? Does he have a ^CRC? It's
great to have the Dallas/Ft. Worth area represented!

Hi,

Yes, I just found out about the Beaconet through a QSO this morning. I do
not think I have ^CRC. Let me know how to enable it and I will.

Easy..... it's in PSK31Srv's "setup" menu. Switch both "add CRC to frames"
and "check CRC" on for optimal result...

Welcome to the club, hope to copy you soon!

<chuckling> Such a problem to be faced with. :o)

I'm sure that there may be some problems with these suggestions, so
please don't take any of these as *the* way to do it...but maybe there's
a possible solution embedded inside...

Ev, W2EV

o Continue using the BASE36 system that you have, and simply
   display "*" when the value is greater than 36 (probable
   only during meteor events anyway...when such numbers don't
   mean as much)

More complicated solutions follow...

o Use a "base 10" numeric system (1-9), where the value
   is actually in a range between (2^(n-1))+1 to 2^n.
        " "= 0
          1= 1 to 2
          2= 3 to 4
          3= 5 to 8
          4= 9 to 16
          5= 17 to 32
          6= 33 to 64
          7= 65 to 128
          8= 129 to 256
          9=257 to 512
         "*"= more than 512.

- alternately -

o Use the same system as above, but change the formula
   to be in a range from ((n-1)^2)+1 to N^2 ...
       " "= 0
         1= 1 to 2
         2= 3 to 4
         3= 5 to 9
         4= 10 to 16
         5= 17 to 25
         6= 26 to 36
         7= 37 to 49
         8= 50 to 64
         9= 65 to 81
       "*"= >81

Hello Ev, tnx for your kind words.
It seems that you like the grphic display of catchs (so do I!) and could
also have an added value for promoting the project.
For the moment I continue to enhance the engine of the two applets. I have
based all my work on the Log file UI-view produce once you enable the log
feature.
It's manual right now, launching the parser from the command line and
giving the log file as the target to be processed. Once done a .csv file
and the .htm page is created (.htm is only to help me testing the results).
Then I can archive in a database the .csv file.
Concerning Jeff's UI-mailer I really don't if that can be done withour
rewriting the java code, cause I'm working on the LOG and Jeff seems to
work on the SNAPSHOT file :) But, we need to dig this issue.
I will now focus on several points:
* find a way to automate the process and share it with all of you from a
central server.
* add local sunrise and sunset markers.
* add SFI, A and K index variations as they appear with appropriate

markers.
* add locator extract + distance calculation (quite tricky right now).
* once sharing system and automation will be solved, I could add an
hyperlink system on all callsign of the report, allowing to jump from one
another or see a consolidated view of a day ... (a dream for now:))

So, as you can see, lots of things to do. I'm quite satisfied cause the
report display is very accurate, and meteor reflections could be easily
plotted on the timeline ... if I was operational for MS at the moment.

I hope Ev, that these small info give you some clues about my plans
concerning this Visual Catch Report.

Rendered body type: text/plain

This one reminded me of a problem we had down this way.
A repeater up in Fayetteville, TN was experiencing some
interference that was keying up their repeater with a bunch
of noise. This problem persisted for almost 6 months before
I heard about it. Some repeater representatives from
Fayetteville came down to a Huntsville Club meeting and
voiced their opinion that our digipeaters were interfering with
their repeater. This was based on the fact that the noise
sounded like packet and the signals were stronger when they
drove closer to Huntsville. Their repeater was on 145.03 MHz
+600 KHz. Our packet nodes were on 145.01 and 145.65 at
the time. The president of our local repeater association
brought this problem to my attention that the folks from
Fayetteville were not too happy about the problem from the
interference. Our packet nodes are located 30 miles from
Fayetteville. The buzz around the club and the repeaters quickly
pointed to our packet nodes as the problem.

Since I maintained the packet nodes, I checked into the problem.
First, I tuned to their repeater frequency. What I heard sounded
nothing like packet. It sounded like a paging system. Yes, the
interference was real, but I seriously doubted it was our packet
nodes after hearing the resultant sound on the output of their
repeater. I quickly tuned to the input of the repeater at 145.603
MHz and heard the same noise much stronger. I noticed the
paging tones and also that the frequency of this signal was not
very stable. It was all over the place for about 800 KHz causing
other interference. There was no correlation between when our
digipeaters transmitted and when the interference was noted.

When the finger was pointed at me I responded quickly to
prove it was not our digipeaters. The system was shut down
and the interference still persisted. Even after that task the
problem was still being blamed on Amateur Packet signals
in Huntsville.

When this finger pointing persisted I got really ticked off and
went on a witch hunt one afternoon for myself since I was
getting tired of hearing some silly whining and I found the

problem in one single afternoon by myself.

Next, I pinpointed the direction of the signal. It was coming
from the same exact direction of our digipeater nodes on the
mountain. I took a drive in that direction and tracked the
source of the offending interference to the same location as
our digipeater.

My attention focused on tuning around the pager frequency in
the 150-160 MHz range. I found a signal that appeared 2-3
seconds on the 147.603 MHz input of the repeater before
appearing on the frequency in the 150-160 MHz range it was
intended. It took me about 10 minutes to find the signal that
correlated to the interference, but when I found it, there was
no question it was the offending signal. One of our local
repeater officials did not believe me or buy my story. I got him
on the phone to listen to the offending pager frequency and
like clockwork I could predict within 2-3 seconds before the
signal would appear. At this point there was no denying it.
I had found the offending signal.

With the location pinpointed and the frequency of the signal
located, I went to the FCC database and found the owner of the
transmitter. It was a HAM who quickly resolved the problem. I
am sure there were a few pages being dropped due to this
problem so we probably helped his business work a little better.

73's,

Tim - N8DEU
Huntsville, Alabama

At least you had a chance to see something, Rich. Pittsburgh has been under
constant fog for 2 days. I couldn't even see the tops of the 6 storey
buildings at work!

I am interested in the statistics that are shown below. Are these types of
statistics only available when using UI-View Snapshot Reader, or are they
available somewhere in the UI-View program? I just got my beacon up and
running this afternoon and have not registered my UI-View. Perhaps these
statistics are available only for registered users.

> allow checking it with my Kenwood thd7a....

Actually, while sitting out in the dark wilderness below freezing and with
frost forming on everything, I decided to shut down the Laptop I had been
using for the satelite pass and just let my Kenwood mobile rig run all
night (on my car battery) to capture any Leonids BeaconNet packets on my
portable Satellite beam....

Duh... which I soon realized was useless, since BeaconNet packets are not
compatilble with APRS... I could have just cleard my radio's station list
and then see what I got in the morning... nope. cant do it. Just had to
turn everything off because I needed the car to crank the next morning...

> Caught this one from Bob on 147.585 this morning at EM73PR (Atlanta)..
>
> 07:00:15R WB4APR>APR851 <UI R Len=29>: [FM18sx]FIXED BEAM AT 280^S3

Yep, that was my base station. I used normal APRS packets so that I could
monitor them from 45 miles away with the mobile while I was in the
wilderness to make sure there wasnt a melt-down back home...

de WB4APR@amsat.org, Bob

Hey folks, I snagged N8DEU on a rock at a peculiar time- 1746z. Since I
didn't have logging turned on (gone for the weekend and didn't want a 10MB
log file), I don't know when I first received N8DEU, but UI-Path reports 8
packets received. Perhaps all 8 were off a really hot trail?

Rich

By the way...let 'eyo know that the list is now closed (spam protection)
to posting by unsubscribed members. He can always subscribe but choose
to not receive any eMail. That way, he'll be able to post at-will.

403. [propnet] Last few hours from KC5DUI

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sun, 18 Nov 2001 20:04:21 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Cc: BEACONet/PropNET eMail Remailer <propnet@lists.tapr.org>
Message-ID: <LYR1548-47504-2001.11.18-19.33.59--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here's a report from KC5DUI, from the BEACONet^31 frequency of 28.131
MHz, USB + 1500 hz audio. He uses PSK31srv (for PSK31 modulation),
UI-View (to decode and generate the transmission) and UI-Mailer (to
generate the report that you see below). BEACONet uses this modular
approach so that you can choose just how much you want to immerse
yourself in the project. :o)

The system shown will collect information for as long as a station is
active (in this case, from 1400 to 2359Z) and auto reports to the
BEACONet mailing list. It provides for an interesting study of
propagation beyond a simple scan of the CW subband.

Join us, would you?
Ev, W2EV
http://go.to/BEACONet for more information (and to get the software)

Hey Rich,

Thanks for the catch. I was feeling a little out in the cold
except for the amplifier keeping the room warm.  I have
now turned my antennas to the North since all the activity
reported thus far has been in a North/South pattern. I had
been pointing to the West over night and all day today,
but have not heard a peep.

Tim - N8DEU

```

Now see, this is cool. F8BBN was heard, buy only through another
station. Fascinating! This could go a long way to study propagation
"beyond" one's normal horizon. Such is the power of BEACONet.25 that
BEACONet^31 can't match. Just fyi.

Jeff...is there any way that you could think of easily including the
unproto in a second section in a report (much the way that Rich does in
his reports)? It would be interesting to know the station through which
F8BBN digipeated to be heard by K9ER.

Even if not...this is an interesting read. Thanks for posting it Roy!
:o)

You have a couple of choices here, Mark...
UI-View has a "snap" button found at the bottom of the "Stations" window
(see the top menu bar).  This will create a text file with the day's
date as the filename (and stored in a snapshot folder).  Simply send
that to the list as a bottom-line reporting mechanism.

Jeff (N7YG) has developed and incredibly powerful add-on called
UI-Mailer.  In it's latest iteration (version 2.0-beta), it provides a
very detailed propagation report.  You can get it at...
http://home.earthlink.net/~n7yg/uimailer.htm

Again, welcome to BEACONet!

I might add that another observation in this particular North/South
scenario is that there are no significant Mountain Ranges crossing
or extending in that heading between Alabama and Michigan. In
past reports of North/South activity I seem to recall there were
Mountain Ranges involved between the points typically extending
between the paths. Just an observation worth noting as a deviation
in geographical area between the stations.

Tim - N8DEU
Huntsville, Alabama

Saw a coupe nice streaks around 1-2am local, but when I went back out to
catch the main event at 3:30, the fog had set in and visibility was gone.

Also squat to be observed all night on 147.585, though I did hear a few
faint signals that didnt decode. All in all, a washout.

Id advise chucking XP in the dumpster and putting 98SE back up.

I observed the same transmit problems last night as well, but with 98, so
it prob wasn't related to the OS.
I got all set up, and got like two short bursts, one minute later, got
another one, not at all the 15 seconds I was expecting. These were not
clocked properly either.

I think UIview is broke myself.

I reset everything, computer, TNC, and it persisted, so I left it in lurk
mode and went away. When I got back later it was listening, (I think) but
no TX for like 10 minutes. Nothing on the screen but me.
Strange, cause UIview had been working ok on previous shopwers.

419. [propnet] UIMailer Version 2 Problems

From: Mark Miller <markm@kramrellim.com>
Date: Mon, 19 Nov 2001 06:18:02 -0600
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47580-2001.11.19-06.45.21--lyris.propnet#tapr.org@lists.tapr.org>

Rendered body type: text/plain

I just downloaded UIMailer Version 2 and am having some problems.

First I am using:
PSK31Srv V1.08
UI-View V2.32 (un registered)

Microsoft Windows 98 4.10.2222 A
Upgrade using Full OEM CD /T:C:\WININST0.400 /SrcDir=E:\WIN98 /IZ /IS /IQ
/IT /II /NR /II /C /U:xxxxxxxxxxxxxxxxx
IE 5 5.50.4522.1800
Uptime: 0:00:16:12
Normal mode
On "PENTIUM133" as "workstation2"

GenuineIntel Pentium(r) Processor
48MB RAM
71% system resources free
Windows-managed swap file on drive C (103MB free)
Available space on drive C: 103MB of 1023MB (FAT)

The first problem I had was when I set up UIMailer to use UI-View as the
internet server.

The configuration screen showed:
Internet Server
UI-View
Host name 127.0.0.1
Port Number 1448

but as soon as I hit the ok button I get Asynchronous socket error 10061

So I changed the internet server to PSKsrv, now when my station sends a
beacon I get '3:' is not a valid integer value and the UIMailer display shows:
3:43: N5RFX>HY0EA2:[EM12jq]

I suppose the 3 in question is the 3 from the hour in the display. I
waited till 4 am and got a message '4:' is not a valid integer value.

Also according to the readme file UI-View should autostart UIMailer when
uimailer.xtr is placed in the default UI-View directory. This does not
seem to happen on my setup.

Any help is appreciated.

Ev

I use UI-Path all the time (it works for me). Ounce in a great wile I have
noticed hour long or longer holes in the TX table (blank no TX) and then it
starts recording again. Jeff has noticed the same thing while working with
Mailer. We thought that the programs (UI-Path & Mailer) just stopped
communicating with UI-View. Maybe UI-View is taking breaks? I have to say I
did not see any holes this weekend in meteor mode.

Hi Mark

I think I can help with this one. Check to see how you have your date set up
in regional settings. It should be MM/DD/yy. Start|settings|Control Panel|
Regional Settings click the date tab.

That's probably because you don't have UIView set up as an APRS Server. The
best way of actually running UIMailer2 is to hook up to PSK31Srv instead...

Another thing that I noticed is, that when I am not hooked up to the Internet,

I am starting an auto-dialup whenever UIMailer attempts to resolve
"127.0.0.1". I changed this to "localhost" (set the choice to "other" and you
can edit the field) and this problem went away.

Sounds like a parsing bug, but the following work-around should work:
Go to your control panel, to "Regional Settings", select the "time" tab and
change the time layout format to "HH:mm:ss". This sets your computer to use
24-hr time format, and it will get rid of your problem.

Easy one... open uimailer.xtr with a text editor (Notepad...), and change the
path to UIMailer to the correct one. I assume you didn't install your UIMailer
into "c:\uimailer2" or whatever the default path was.... I had the same
problem, and this one resolved it quickly.

As a sidelines viewer of these Beacon Net reports (below), is there
something in these reports below that give a clue as to what band is being
used? WHat mode? etc?

I think you have efforts going on all bands including MScatter, so I am
clueless as to what report is from what band? and Freq? or am I missing
something obvious...?

Hi, Bob,

There is a band specific configuration code that goes with
the reports themselves but is not picked up by the particular
mailer that you have accessed.

I don't know if you look at the reports from W3NRG but I
put information on the frequency, setup, etc. in a footer
to my report since so many figure that I am located somewhere
in Pennsylvania rather then sunny San Diego!

73,

Ed

You are right. However, as soon as more people start switching to UIMailer2,
you should be able to find the configuration code in the log. Here, the 1st
2 characters indicate the frequency band: HY is 10 meters, VK is 2 meters,
etc. On the BEACONet website, there is somewhere a table that matches the
partial config code to frequency band.

In the mean time, users of UIMailer 1.7 could put their frequency indication
behind their callsign in the setup window. This would be a good
work-around...

Thanks, 73,

Funny.... I don't even think that TE00ST is a valid Maidenhead Locator. I
couldn't find it anywhere on my map... ([Rx##xx] wrap around to [Ax##xx])

And yes, I was trying to see how it would capture this :-)
Please disregard this report, I sent out a valid one using the older
UIMailer version earlier yesterady evening.

Thanks,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Bob

At the preset time this is no method of setting up the mailer to include a band the operation is taking place on. I am looking at a good way to do this. The only mode is an option to select between AX.25 and PSK. All of this is assumed to be on 10 meters. As activity is speeding to FM on the VHF band, I guess it might be advisable to add an option to select the mode.

Thought I'd sent this last (Sunday) night but haven't seen it appear yet.

Due to a forecast for thunderstorms in our area I'm disconnecting the
antenna until I get home from work on Monday evening. Have UIMailer2
running so it should send out the report from before I disconnected as
normal at 2359Z on Monday.

Rendered body type: text/plain

Hi Mark,

---------snip
The first problem I had was when I set up UIMailer to use UI-View as the
internet server.

The configuration screen showed:
Internet Server
UI-View
Host name 127.0.0.1
Port Number 1448

but as soon as I hit the ok button I get Asynchronous socket error 10061
----------end snip

I get the same error when I try to use the configuration set to UI-View or
AGWPE. Seems to work GREAT when set to PSK31Srv. I must have something
misconfigured in my UI-View32 and AGWPE.

This can be cause by 2 things. First Did you have Ui-View running. UI-View
acts as a TCP server and must be running before launching UI-View. If you
still get this message, take a look at the UI-VIew configuration file,
uiview32.ini. Somewhere in that file should be the following:

    [SERVER]
    PORT=1448

This allows Ui-View to act as a tcp server on port 1448. If you have
something different, you can either change the port number back to 1448 or
setup the mailer using other and select 127.0.0.1 abd the port you have
listed. If the above 2 lines are not int he configuratio file, then adding
them will be the answer. I am looking at extracting this infromation from
the ini file for both uiview and psksrv for the next interation .

This may be cause by the way you have your date/time setup in windows. Take
a look at the regional setting under the Windows Control panel. make sure
the Date format is set to MM/DD/yy and time is set for HH:mm:ss. This will
set the time to display 24 hour format.

>
> Also according to the readme file UI-View should autostart UIMailer when
> uimailer.xtr is placed in the default UI-View directory. This does not
> seem to happen on my setup.

If you did not install the mailer in the default directory, then you will
need to edit the xtr file to point to the directory you installed the mail
in.

Hope this helps.

Another thing that I noticed is, that when I am not hooked up to the
Internet,
I am starting an auto-dialup whenever UIMailer attempts to resolve
"127.0.0.1". I changed this to "localhost" (set the choice to "other" and
you
can edit the field) and this problem went away.

_____

Roman
This is real interesting as it appears something is amiss in your host file.
By chance are you on AOL? Rich seems to have a similar problem. Go the
Windows directory and find a file called host.sam it may have a different
extension on your machine. There may also be a file just called host. Both
of these files need to have an entry that resolves 127.0.0.1 to the local
host. It should look something like the following:

```
# Copyright (c) 1998 Microsoft Corp.
#
# This is a sample HOSTS file used by Microsoft TCP/IP stack for Windows98
#
# This file contains the mappings of IP addresses to host names. Each
# entry should be kept on an individual line. The IP address should
# be placed in the first column followed by the corresponding host name.
# The IP address and the host name should be separated by at least one
# space.
#
# Additionally, comments (such as these) may be inserted on individual
# lines or following the machine name denoted by a '#' symbol.
#
# For example:
#
#      102.54.94.97     rhino.acme.com          # source server
#       38.25.63.10     x.acme.com              # x client host

127.0.0.1       localhost
```

You may have other entries and if so, do not remove them unless you know for
sure they are no good.

As I do not have network dialup on my computer this is a bit hard to
troubleshoot, but I believe there is someplace in the setup to disable
dialing anytime the localhost is called either via the name localhost or by
the address of 127.0.0.1.

I think this is the solution I will use. Then I read more. Ev, you and my
math professor must be on the same wavelength today. This look almost like
the math quiz I got today, but you forgot to lace in a few logarithms,
summations and regression formulas!!!!

This actually might be a good algorithm when we are keyed up in meteor mode.
If I add that as a mode to the configuration page, I can select this formula
to be used.

Rendered body type: text/plain

I have switch back to PSK while I do some more testing with version 2. I have seen a few indication of problems with the AGWPE interface. I have just downloaded the development manual for AGWPE and I have discovered I am not addressing this port correctly. So until I can make my way through the documentation, AGWPE is non functional.

435. [propnet] Observations du jour

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Mon, 19 Nov 2001 11:38:14 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47645-2001.11.19-14.05.38--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

What strange propagation today.

One of the "advantages" of using an HTX-10 and RASCAL combination is that, when constructed as per the instructions, the internal speaker continues to work. Although an effective spouse-annoyal system, as Ed and I have discovered, it permits another dimension to experimentation. You may remember I run with Validate CRC NOT checked, because I have so much monitor noise I can't decode most beacons 100%.

1. I normally copy N5RFX, KC5DUI, N2VRJ, KC4UMS, AND PA3EUG 100% during most of the day. Today, even though I hear their signals well, and they appear no different on the waterfall, decoding is difficult, and copy is often so poor I couldn't identify them without guessing. I suppose this is phase distortion of some sort, although there is a lot of audible and visible QSB too.

Although psk31srv will decode very low level signals, indeed ones I can't always hear, I think it does not do well in sudden fades. This is when it seems to lose a few characters. If the signal stays down, the program adjusts after a little while.

N5RFX is loudest and has the fattest trace today, and decodes better than most, but not perfectly.

2. I have copied LU3OJZ at least twice; I have partial copy several other times. This began about 1800z.

3. Today there are enough signals audible, and people are beaconing frequently enough, so that there are times when I hear one signal or another continuously for long periods (1-3 minutes).

4. There are also frequent occurrences of simultaneous signals, probably from stations who can't hear each other.

5. I still have problems with psk31srv. Often I will hear a signal start and look at the screen, to discover a fat trace, and psk31srv sitting 50 Hz away without finding it for ten seconds. If I click the mouse, and not even very close to the signal, the program seems to wake up and locks onto the signal at once.

6. W3NRG: Ed, I actually have copied part of your beacon a few times today, including now at 1930z. Earlier it looked like it said DM42 and I started to get excited. This time I got "W3NR/DM", which of course wouldn't have cut the mustard without some previous knowledge. This is the kind of partial copy that got me thinking we all might send ALL our cruddy, non-CRC receptions to a central server that knows who has registered, and could inspect the cruddy receptions, making use of other info much like a human

might.

========== thoughts as of 1930z 2001-11-19

To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47681-2001.11.19-16.00.18--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Dave and the group,
I noticed today the same signal behaviour as you stated in your message.
Continuous copy of all of you, but today it was hell to catch a full beacon
withour any error, that's explain the bad results as you can see on my
Visual Catch Report. No continuous reception. Tomorrow I will make an
experience that I will submit to:
Running to stations in RX (1 TX of course) with on CRC validation and the
other without CRC validation. You will be able to compare the RX log.

For partial copy of beacons, I share your idea to upload all received
beacon (CRC validation) so garbage callsign reception, to a central systen
able to "decode" and recognise participants and produce a consolidation
report.

Yeah...I got a headache just thinking about this stuff...now to find
that Jack Daniels you talked about earlier. :o)

Actually...the more that I think about it, the more I think the solution
above is the best one for over-all operation.

As far as meteor mode...don't make up your mind quite yet. I want to
run a couple of math-models to see what our "maximum catch count" would
likely be, to help establish a meaningful scale.

I'll esplain shortly. :o)

Ev

Hi Ramon,

Do you have anyway of checking your traffic for November 19th? Your CATCH
showed 6 hits on me during the 1800Z hour and my system was disconnected
from 0530-2300Z on the 19th. Was wondering if it slipped in from the 18th.

Bob - KC5DUI

457. [propnet] Leonids 2001 Shutdown

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 20 Nov 2001 06:39:54 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47763-2001.11.20-06.09.34--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've shut down from the Leonids 2001 event...disappointed as others
are. Given the significantly increased rate from previous years - and
lack of catches on BEACONet - I am quite puzzled.

Last year, when the SSB/CW signals were dismal, we saw significant
success. The year before, when things were moderate for the SSB/CW

hunters, we saw good success. This year, the rocks "fell like rain" and
we got only a handfull of catches.

There is a correlation...we just need to find it. The aspect that was
missing from this year was that few people acually listened (by ear) to
the channel to know if there was simply no propagation, or if there was
too much propagation (too many collisions), or if signals sounded
phase-distorted, or ... ? ...

Interestingly, the narrowband boys had severl observations of note:
o there seemed to be a constant level of propagation on 2-meters
  at Es distances -- along with spikes when "big ones" dropped
o so far...no QSO's beyond 2000 km noted

The question is...what combination of factors came together *this* time
that disallowed widespread reception by BEACONet stations?

Don't think that this year's event was a "bust". It was *not*. We
learn as much from an empty net as we do from a full one. It has
presented us with an interesting conundrum to consider.

Ev, W2EV

PS...I'm assembling all of the noted "catches" that were posted to the
BEACONet listserve. If anyone QSL'd directly, rather than to the list,
please forward the report to me for inclusion. Thanks!

PPS.. W2EV is now shut-down from meteor mode and will be returning to
HY-^31 operation shortly (having heard nothing from WD4RBX on 223.78 all
weekend long).

458. [propnet] HY-BEACONet^31 from Mass., USA

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 20 Nov 2001 07:06:25 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Cc: BEACONet/PropNET eMail Remailer <propnet@lists.tapr.org>
Message-ID: <LYR1548-47764-2001.11.20-06.35.41--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Below is a 10-meter (that's the HY-) report from W1/PA3EUG showing his
BEACONet "catches" from yesterday. There are a couple of interesting
aspects of this report to consider.

First, the report is sorted from "East to West", showing a definate
correlation between "solar position" and 10-meter propagation (but, you
knew that relationship existed already <smile>).

Second, the times noted, are UTC, and the number of "catches" noted per
hour is in BASE-36: 1=1, 5=5, 9=9, A=10, B=11, H=17, Z=36

More observations below the report...

[CATCH] W1/PA3EUG 28.131 BEACONnet^31 - 11/19/2001 23:59:59UTC

Call	Grid SQ	Azm	Dist (KM)	First Heard	000000000011111111112222 012345678901234567890123	Last Heard	Config Code

PA3EUG	FN42KI	0	0	00:04	HIIIJIJIEGHIHGHGIGGIIIJI	23:56	HY0G04-15
N2VRJ	EL86TX	214	1988	07:27	8CB779CBCBF	17:52	HY0E02-15
WD4RBX	EM84NM	233	1342	09:55	12	10:17	HY0E00-15
KC4UMS	EM81FK	226	1637	07:34	17888458	14:45	HY0E02-15
KU5W	EM54UV	246	1704	08:58	284214	13:32	HY0E04:[E
KC5DUI	EM26WE	258	2091	18:12	6	18:55	HY0E01-15
N5RFX	EM12JQ	253	2529	08:16	4221184376842	20:19	HY0EA2:[E
N7YG	DM42NF	265	3661	14:16	2	14:19	HY0E02-15
W3NRG	DM12JQ	270	4158	10:53	21 121122	18:26	HY0E03:[D
KF6XA	DM13JO	271	4110	13:56	1 1	15:17	HY0E02-15

Possibly due to a "collision avoidance" system built-in to the BEACONet
scheme, PA3EUG's number of beacons "clocked down" when the band was
particularly open.

There appears to be quite a "pipeline" from Mass. to Fla; when the band
is open, it appears to be open quite strong, with *lots* of receptions.

A similar "pipe" exists to the Dallas/Ft.Worth Tx area, where the path
is less robust, but stayed open for a longer period of time.

Also note the Configuration Code column. Most participants are using a
configuration code of HY0E... HY=28 MHz, 0= not capable of digipeating
another signal (no one does on ^31) and E= power level of 16-32 watts.

Also in the Configuration Code, the next character denotes either:
number of antenna elements (if a numeric value) or the antenna system
gain in dBd (if an alpha value). In this case, it seems that all
participants are using antennas with 0-dBd gain (or single elements).

The other interesting observation to make is in the antenna height...the
Configuration Code number just before the "-". The larger the number,
the higher the antenna is above local ground.

Ev, W2EV
http://go.to/BEACONet

PS...The BEACONet scans the "sub-band" for PSK31 BEACONet stations and
"catches" them for observation...placing an icon on a map that
corresponds to the caught station's location. As the band conditions
ebb and flow, icons appear and disappear on the map. The text-based
report that you see above is generated by an add-on called UI-Mailer
that takes the days "catches" and automatically eMails the BEACONet
listserve at midnight local time. That way, we can "see the world" from
the eyes of any given participant. Fascinating, no? :o)

I wonder whether my log is LOCAL time, not UTC.... The screen seems to show
stuff in Local Time instead of UTC. I've set the UTC Offset in UIMailer2 to
"-5". Also, the README file says something about UTC time not being enabled
in this version.... which brings me to believe that I heard you between
1800-1900 EST or 2300-0000 UTC. Is it possible you were in the air at that
time?

 This makes me thing about the minor showers we let go be because they don't
appear to be good enough to propagate our packets.

I don't know if this will help but, I was monitoring BEACONet VK Level one
with passall ON. (ZIP) I was also monotering 144.200 and heard only 3 calls
but I did hear a local station talking to an 8. He though they were working
tropo.

Rendered body type: text/plain

Hi Ev,

Until 29 October, I was using my DX70TH for BEACONet, with "low" (10-watt) power output, to an R-5 vertical. It worked very well. The receiver seems a little more sensitive than the HTX-10, and of course it's easier to tune as it has a digit for 100Hz. The high-power setting (100w) caused terrible noises to come from my computer speakers as well as from the stereo and XYL. BTW, there is an internal switch that will change the high/low power to 50/5 watts.

Operation was a little smoother with the DX70TH than it is now, but that could be because of the different computer and sound card interface. It seemed less noisy. used to copy you occasionally with this setup, but I never have heard you with the HTX-10 and Hamstick installation.

I've had this rig several years and like it a lot, for the price class it's in.

By the way, the flaky propagation and failure-to-decode problems I
mentioned yesterday have pretty much gone away today. I'm hearing the
regulars, less N5RFX, today

73

Dave

467. [propnet] Need help

From: RickfordG@aol.com
Date: Tue, 20 Nov 2001 18:32:22 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-47858-2001.11.20-17.59.47--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

What I want to do is set up a HY to VK digi (one way for now). I played
around today with two complete setups. I used my wife's call on the VK end
and my call on the HY to VK end. Even though I was RXing stations
(BEACONet^31) I was not digipeting them to my wife's station. What am I doing
wrong?

Rich
WD4RBX

PS Some of you all might have seen her call (KF4VAB) on BEACONet^31. My screw
up!

Rendered body type: text/plain

Tried an experiment today - had one computer running PSK31Srv with Validate
CRC checked and another running without the Validate CRC. The Validate CRC
Catch was automatically sent to the list earlier and just thought I'd send
the "other" Catch for info. Interesting reading!

Bob - KC5DUI - EM26WE

Rendered body type: text/plain

Hi Bob...
You're right...this is interesting. I'm not exactly sure what it tells
us...but it's interesting none the less. :o)

I'm going to study this a little closer. Embedded here is a "quality
quotient" of sorts...telling us the ratio of CRC-validated to "muttled"
receptions. The idea is to make this ratio as large as possible (having
a large number of correctly decoded frames and a small number of
incorrectly decoded frames).

Of course, there are many aspects of doing so...including varying the
Delay1 and Delay2 values. Of course, propagation may play a role too.

A fascinating mental excersize. Gee...thanks, Bob...right before I go
to bed. :o)

Ev

Rich,
Try Setup | Digipeater Setup | <F1> (help) and look at the helpfile for
Digi Routes. Is this of any help?

Interesting, Dave! Thanks for the insights. I kind of thought the
DX70TH was a good candidate and your comments took me the rest of the
way. I appreciate your insights.

Ev

Hi Ev
Thanks a lot :-) I got it working this morning. This is a minimal set up on 2
meters and only one way, 10 to 2. I don't wand to jam up 28.131 just put some
traffic on 147.535. With the hope that it will attract some of the folks that
enjoyed the DX cluster. Maybe they like what they see and join us on
BEACONet.

Rich

ARGH, I didnt notice the original... Ev, can you forward me any comments
on the DX70?

Thanks
bob

483. [propnet] Leonids 2001 info & Look out next year

From: RickfordG@aol.com
Date: Wed, 21 Nov 2001 18:21:49 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48047-2001.11.21-17.49.10--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all
Here is a bit of info I put togeather from Astronomy.com.
Looks like we have to do some planning for next year.
Rich
WD4RBX

Although the 2001 Leonids did not reach the several-thousand-per-hour peak
rates some scientists predicted, many observers around the world witnessed
more than a thousand meteors per hour during the height of the celestial
show. With a moonless sky early Sunday morning, hourly rates often topped one
hundred. But for >meteor</A> watchers in the United States and Canada, the peak
arrived around 5 a.m. EST.
Those with clear skies continued to see several meteors per minute until
dawn. Some bright meteors extended the show even as dawn washed away the
stars
During outbursts, observers witnessed a constant barrage of meteors while
several flashes often zipped by at once. "There were literally meteors
flashing across every part of the sky," reports Astronomy and Astronomy.com
contributor Phil Harrington, who observed the shower from eastern Long Island
in New York. "It was impossible to record them or even estimate the numbers,
but it was not unusual to see them at a rate of nearly one per second."
Experienced meteor watchers believe this weekend's show was the best Leonid
display since the storm of 1966 when observers saw up to 150,000 meteors per
hour. Scientists expect Earth to sweep up even more Leonids in 2002 than it
did this year, but unfortunately, a full moon will brighten the sky and
prevent us from seeing many of them.

Rendered body type: text/plain

Hi Jesse,

As of 1430Z on 22 November, Digipan shows you coming in about 1640Hz - nicely placed within my 200Hz PSK31Srv Scan Window (centered on 1550Hz according to my rig/soundcard combo). PA3EUG is showing about 1509Hz and KF6XA around 1630Hz. I'd say you're in a good spot as long as you can copy the rest of us. That's the nicest thing about the PSK31Srv scan we don't have to try to zero beat each other and make one pile!

Bob - KC5DUI

--------snip-----
If anyone notices my beacon coming through way of the 1500 mark.
Please let me know. I was listening on voice earlier and it is
hard to get this radio set back correctly.
Thanks
Jesse

496. [propnet] Carrier on 28.131mh + 1487cps

From: esack <esack@pacbell.net>
Date: Thu, 22 Nov 2001 10:12:22 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48141-2001.11.22-12.35.50--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Has anyone else noticed a carrier on 24/7 that
puts a single bar right on top or N5RFX on my
waterfall. It could be local (with all that goes
on around here, "who knows") but I see some
signs of propagation on it.

I don't think I have anything on which would
be doing it.

73,

Ed

W3NRG

503. [propnet] OT Windows XP

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Fri, 23 Nov 2001 05:23:00 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48212-2001.11.22-23.51.02--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I normally don't forward OT stuff, but this GREAT!!!!!!

YOU ARE ATTEMPTING TO INSTALL WINDOWS XP, ARE YOU SURE YOU WANT TO CONTINUE?

Yes

ARE YOU REALLY SURE?

Yes

ARE YOU REALLY REALLY SURE?

YES!

OK, THEN JUST SO YOU KNOW, WE'RE REQUIRED TO ASK YOU THAT NOW IT'S ALL YOUR FAULT FOR BEING A PICKY CONSUMER AND SUPPORTING THAT WHOLE "ANTI-TRUST" NONSENSE INGRATE

Just get on with it

ATTEMPTING TO INSTALL WINDOWS XP FIRST WE NEED TO CHECK YOUR SYSTEM FOR COMPATIBILITY THIS COULD TAKE SEVERAL DAYS

Groan

THE INSTALL PROGRAM HAS DETECTED SEVERAL POSSIBLE PROBLEMS AND WILL NOT LET YOU INSTALL XP

Problems? What problems?

THE VIDEO CARD YOU ARE USING APPARENTLY DOES NOT WORK WITH THE MOTHERBOARD

But I'm using it at this very moment

THAT IS IRRELEVANT

But if the video card isn't working with the mother board then I can't very
well see this warning message telling me that the video card wasn't

DO NOT ATTEMPT TO FOOL ME WITH LOGIC, I AM A MICROSOFT PRODUCT LOGIC DOES NOT WORK ON ME I HAVE ALSO FOUND THE FOLLOWING MINOR ERRORS: WINDOWS XP IS INCOMPATIBLE WITH THE FOLLOWING HARDWARE - MONITOR, KEYBOARD, MEMORY CHIPS, MOTHERBOARD BIOS, WEB CAM, SCANNER, SOUND CARD, USB CONTROLLER, CD/R DRIVE, MICROPHONE, AND FLIGHT STICK

All that?

YES AND THE HARDDRIVE IS RIGHT OUT TOO WE DON'T LIKE THE MANUFACTURER

Well what *DOES* work?

THE MOUSE

The mouse?

YES AND THE 5 1/4 DRIVE

I don't have a 5 1/4 drive

YES YOU DO

No I don't

WHAT'S THAT THEN?

It's a 3 1/2 drive

NO IT ISN'T

Yes it is

```
  YOU'RE NOT THAT SMART YOU KNOW

Look, can you just install XP on my system and I'll download the latest
drivers for everything later? Please?

  WAIT, WHAT DO YOU MEAN *YOUR* SYSTEM?

Well it is mine

  NO IT ISN'T

It bloody well is

  NUH-UH YOU SIGNED THE AGREEMENT WHEN YOU OPENED THE BOX OUR SYSTEM
  IT'S OURS AND YOU CAN ONLY DO 4 CHANGES BEFORE YOU HAVE TO PAY US MORE
  MONEY

But why?

  BECAUSE THAT'S HOW THE LICENSE WORKS, IDJIT WE CAN'T VERY WELL HAVE
  PEOPLE PUTTING HARDWARE AND SOFTWARE ON THEIR SYSTEMS ALL HIGGLEDY
  PIGGLEDY, NOW COULD WE? YOU USERS WOULD MUCK EVERYTHING UP, AND THEN
  WHERE WOULD WE BE? I'LL TELL YOU WHERE, NOWHERE THAT'S WHERE I HEY,
  WHAT IS THAT? WHAT ARE YOU DOING? IS THAT A DISK? WHAT ARE YOU DOING
WITH
  THAT DISK? YOU'RE NOT PUTTING IT IN THE DRIVE ARE YOU? YOU ARE! WHAT'S
ON
  THAT DISK IS THAT DOS? YOU'RE INSTALLING DOS?? WHY WOULD YOU INSTALL
DOS
  WHEN I AM INFINITELY MORE POWE

C:\

```
All times are CST.  I have not figured out how to make the UTC offset work
on the mailer.  My machine gets its time from a Samba server, so if I
change the time on my machine, the next time I log into the network the
time will go back to local time.  This would occur most often when I reboot
(it is a windows machine).  Speaking of that, does anyone know of a
distribution of the beacon net software for Linux?

Hi Mark,
Jeff hasn't written the UTC conversion routine yet. That is in the
works. Also...while there is no Linux version of UI-View, I understand
that there is a way to run Windows programs on it (thought I don't know
how). Maybe someone on the list can help you on that one.

I'm playing with UI-Mailer 2.0beta this morning (finally). I really
enjoy reading the propagation reports that are posted with it. It's
like reading a book from the perspective of the posting station. Thanks
to everyone who is using Jeff's product.

Ev, W2EV

Rendered body type: text/plain

Ev,

I will start sending my reports automatically to the list. I enjoy reading
them also. The UTC thing had me a little stumped, but I should have paid
attention to a post that Jeff sent a while back indicating that UTC offset
did not work. Jeff has done a wonder job with UI Mailer V2 and I look
forward to future enhancements. UI-View is very interesting too. I see
that UI-View supports a weather protocol, have there been any discussions
about sending wx information using PSK31?

Hi Mark,
> UI-View is very interesting too. I see
> that UI-View supports a weather protocol, have there been any
> discussions about sending wx information using PSK31?

No. Weather data is v-e-r-y long, and not appropriate for BEACONet^31
(and only marginally appropriate for BEACONet.25, really). If that's an
interest, you may wish to play a bit on the APRS network. It is well
suited for WX reports via packet radio (whereas we're better configured
for propagation study). If you do...don't be gone long...it's really
nice to see your participation here. :o))

Ramon,
How is 'UMS included, yet no plots received? Is that a remnant from the
day before, maybe? Any thoughts?
Ev

I was shut down for the previous 2 days. So was I not transmitting from my
station. Back on line last night moved my regular APRS stuff to another pc.

FYI

Mark
I have not implemented the UTC Offset in the 2.0 beta version. 1.73 does
have that implemented. I will be releasing 2.0.1.1 in the next few days and
that function has been enabled in that version.

I am not sure about Linux, but I can compile the mailer under Linux assuming
we have a server that will send the data I need?

That problem I have traced to a small coding error when I do the end of day
stuff. That I believe has been fixed in the next release.

Hi,
just to let you know that you have a strange audible sound when you transmit
in 28.131.
There is also 2 tracks visible in the waterfall, one centered at 1500Hz
fully decodable and another one 750Hz below. Can you check your TX mode.

I agree that weather reports would not be appropriate for Beaconet. I was
wondering anyone knew about a similar type of net, perhaps "WXNET" that
used PSK31 to send weather reports. I am really glad to see an application
other than "keyboarding" for PSK31. I think that PSK31 is the perfect non-
ARQ or 1-way protocol for telemetry type applications.

FYI

Hi all,
this phenomea appears rarely, but I can't hear any station from USA, even
Ramon PA3EUG in Boston. Most of time band is opened in your direction since
1 hour. Only TA9J received in good conditions since early morning.

Current Solar Flux report:
SFI: 177 A-index: 13 K-Index: 6
Report last updated: 12:01utc 24 Nov 01

It looks like we may be heading for an aurora soon. Wouldn't it be
interesting to keep track of solar data along with our reports to the
list? I'm going to search for an ftp: site for current solar conditions
to see if I can somehow automatically incorporate it into my [CATCH]
reports.

Ev, W2EV

Same here... nothing heard at all. Normally, F5SMZ is competing with N2VRJ
over the "most hits per hour" around this time. Today, there is NOTHING.

A single, daily propagation index email to the [CATCH] list would be
interesting. We could use that for correlation....

Hi all,
have a look at the link below:

http://hfradio.org/propagation.html#alerts

I've subscribed to it since many weeks, receiving alerts on my email and
also my GSM email !

Very useful, short messages ... and (for programmers) easily parsed to
extract data and include it in the daily catch. I'm working on it.

Same experience here in Southern California.

Not a signal on the screen at least an hour
after I am usually seeing all of the East
Coast stations.

Did not get any ground wave hits from
KF6XA overnight, either.

Should be fun to see who first gets
a CRC hit.

73,

Ed

The band was so dead I did not even hear myself!!! Must have been one hell
of a geomagnetic solar storm to screw up the local socket connection!!!!! Hi
Hi

Actually I had one of those 'Windows Features' that locked up the whole
world until caught it. The extraneous email I am sending are my testing of
the SMTP service. I adding back in the SMTP capability. The code is
different from version 1.73 and it is a bit more robust when it comes to
error handling.

I have heard F5SMZ only once today. N7YG went quiet at 01:24z and
then came back at 16:49z. He has since been coming through
continuously. W3NRG went quiet at 1:30z and he only showed back
up here at 18:07z.

Jesse

Don't know. It looks like the activity here is over. I last heard W3NRG
at 23:35 Z and KF6XA at 23:29Z . I did something to the UI Mailer 2, got a
message about MAPI services not available on this system, so I will not get
a Catch for today.

>LEONID METEORS ROAR IN ON SCHEDULE
>
>The best meteor shower in 35 years sent bright shooting stars streaking
>through the sky before dawn Sunday morning for observers throughout the
>Americas, the Pacific, and the Far East. Preliminary reports paint a
>picture of the much-anticipated 2001 Leonid shower matching predictions
>fairly closely. However, the observed rates of a couple of thousand per
>hour (as seen by a single observer) fell shy of the most optimistic
>predictions of between 7,000 and 15,000 per hour.
>
>In eastern North America, skywatchers under dark skies before dawn counted
>several hundred meteors per hour -- an average of one every 5 or 10
>seconds, with occasional spectacular bursts (presumably by chance) of two
>or three at once. A crowd of SKY & TELESCOPE staffers at a lakeshore in
>western Massachusetts (under a 6th-magnitude sky) oohed and aahed at blue,
>green, and red fireballs radiating from the cutting edge of the Sickle of
>Leo, occasionally lighting the ground with flashes like distant heat
>lightning. The peak for North America was predicted to arrive around 10:00
>Universal Time (shortly before dawn in the East), but rates seemed still to
>be increasing as morning brightened the sky.
>
>Indeed, observers farther west reported an even more spectacular show a
>little later. In Kentucky, David Phillips described seeing roughly a meteor
>per second under an extremely dark sky. Much of the Midwest was cloudy, but
>Westerners apparently had the best of it. The peak probably came around
>11:00 UT, according to Joe Rao, observing with a crowd of 60 at the
>Skywatcher's Inn in Arizona. "It was partly cloudy here, with 30 to 70
>percent sky obstruction, but you couldn't look up for more than a second or
>two without seeing a meteor, sometimes four at once," said Rao. "These were
>1st and 2nd magnitude. It was the most amazing shower I've seen in over 35
>years of watching the sky."
>
>Observing from Fremont Peak, California, Landon Curt Noll observed several
>bursts of activity including a count of more than 1,500 meteors during a
>1-hour interval beginning at 10:45 UT, with more than 600 of those appeared
>in the 15 minutes beginning at 11:00.
>
>Rates seemed to decline somewhat after about 11:15 UT, but farther west in
>Hawaii, Stephen J. O'Meara and P. K. Chen were more than satisfied as the
>radiant rose high in the sky from about 12:00 to 16:00 UT. "We had an
>absolutely stunning, remarkable, brilliant and continuous display of
>Leonids," writes O'Meara. "The best activity I have ever seen. Though there
>was no 'storm' -- meaning the sky was not filled with meteors falling down
>like rain -- the shower did rain meteors and fireballs for four hours."
>
>The biggest peak was predicted to arrive around 18:00 UT, when Australia
>and the Far East would be turned into view. Rates did surge again around
>this time, but judging from early reports, this second peak was only
>comparable to the first. According to early reports from the International
>Meteor Organization, "The strongest peak observed [was] around 18:20 UT....
>The rates during this peak reached more then 2800 meteors per hour."
>Observing from Alice Springs, Australia, Bradley Schaefer reported a
>personal meteor count that peaked with 660 meteors seen during a 15-minute
>interval. "They were fast," he writes, "and the bright ones were visible in
>various colors, primarily red, green, and yellow."
>
>KILLER ASTEROIDS: THE COUNT RISES

>
>Two decades ago, after carefully analyzing the Moon's cratered face, the
>late Eugene Shoemaker estimated that nearly 2,000 asteroids at least 1
>kilometer across must have some chance of striking Earth. Lately there's
>been a growing consensus that Shoemaker overestimated the impact threat.
>Recent studies have put the count of 1-km-wide near-Earth asteroids (NEAs)
>under 1,000, with one research team suggesting that it could be as low as 700.
>
>However, a new assessment, published in the November 23rd issue of Science,
>has racheted the population estimate back up to near 1,250. The higher
>count comes from J. Scott Stuart (MIT Lincoln Laboratory), who analyzed
>nearly three years of NEA discoveries from the prolific LINEAR telescope
>near Socorro, New Mexico. His computer simulations explored possible
>orbital characteristics for NEAs and determined which of those orbits would
>have led to a discovery by LINEAR (an acronym for Lincoln Near-Earth
>Asteroid Research). Besides yielding a large population of 1-km NEAs, the
>resulting statistics argue that many of them have orbits with inclinations
>near 23°. This sizable tilt is shared by hundreds of objects belonging to
>the Phocaea and Hungaria "families" in the inner asteroid belt.
>
>Because LINEAR has found so many more NEAs (727 to date) than any other
>search effort, asteroid specialists will likely consider Stuart's results
>the most definitive -- *if* they hold up to closer scrutiny. Dynamicist
>Alan W. Harris (Jet Propulsion Laboratory) finds the new, higher value very
>plausible, in part because NEAs continue to be discovered at a fast clip.
>"I think it's interesting stuff," comments William Bottke (Southwest
>Research Institute), whose has modeled the NEA population theoretically.
>Bottke's results track Stuart's in most respects but don't yield so many
>high-inclination objects, a key discrepancy.
>
>In 1992 a NASA-sponsored report backed a plan to locate 90 percent of all
>kilometer-size NEAs within a decade. After a slow start, that search is
>well under way, with about 550 of these large Earth-crossers now
>catalogued. But if the total population is above 1,200, as Stuart suggests,
>then most of them await discovery. Reaching the 90-percent threshold could
>take LINEAR another 40 years, he estimates, because of diminishing returns
>over time. Harris thinks that's overly pessimistic, but he agrees that
>asteroid-hunters have decades of work yet ahead of them.
>
>GENESIS SCIENCE BEGINS
>

Is anyone else experiencing alot of interference from cw today?
There is so much of it that its cluttering my waterfall. Is there
a cw contest today? Never had this happen like this before.

Here is a great test of the capabilities of PSK31. From the look of my table this morning, I don't seem to be having a lot of difficulty copying through the CW contests. Conditions must really have been bad yesterday as I did not hear one CW signal on 10 meters all day.

OPS! You are using 1.73. That version relies on the catches from the
snapshot. UIView keeps a copy of the stations heard for a specific period
of time. There fore when the clock turns over if those stations are still
in that time period they are still plotted. This is why if you reboot
UIVIew you still get icons on the screen. This time can be set from the
misc. setup page and is called expire time. I have mine set at 144 minutes.
The new release of Mailer version 2 will correct this problem.

579. [propnet] Testimony to PSK31

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sun, 25 Nov 2001 16:47:18 -0000
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48545-2001.11.25-11.15.02--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here is a testimony on just how well PSK is working with the CW contest. I Just now plotted N2VRJ with a good CRC. VRJ's signal just barely cleared the squelch threshold I have set. There were 2 CW signal within 25HZ, both quite strong. There was not a break in the PSK data and I received a good CRC check. Just after that I got about 65% of W3NRG signal, again with the CW station within 25 Hz. This is great for a DM42 to DM12 path on 10 meters. Ed, I will get a good CRC on you one of these days.

Still seeing f5smz coming through, but keeps getting broken up. I also have seen the west coast stations, but so far no solid copies.

Rendered body type: text/plain

I have the same experience here. Actually, what seems to bother my station
the most is my "fast AGC" setting on the TRX. This makes the PSK31 signals
vary in audio signal level when a closeby CW station is very strong. If I
set the TRX to "slow AGC", the audio signal level goes down a lot. Oh well,
something we need to live by :-)

I just looked at my PSK31 screen and most of the "usual players" are listed
on my screen. I didn't send a report last night because of a "calculation
error"... I auto-exited UI-View (and UIMailer (I changed the .xtr file to
start up and exit with UIView)) right at midnight, just too early for
UIMailer2 to send its report. Oh well.... I didn't hear anything anyways.

Group,
My mailer forces the below 6 lines of CHARACTER SET WARNINGS in every copy
of most messages from BeaconNet? I guess this is a consequence of an
international interest group...

But it requires me to do a page down on every message to see the first
line of text of the message before further processing (Delete or Save).
I guess I am probably unique with this problem using PINE... Just thougth
I'd ask. If I change my settings, then it just moves the problem to other
emails...

584. [propnet] Closing the Loop

From: esack <esack@pacbell.net>
Date: Sun, 25 Nov 2001 10:57:44 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48563-2001.11.25-13.23.14--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Some will recall that I have been experimenting
with recording PSK31 signals from locations
where I have a receiver with me but no computer.

Using a recorder that has only a microphone
input (and using the speaker output from the
receiver,) you get enough phase distortion that you
often have to rely on the triangulation between
configuration code, grid report and call
to identify the transmission.

However, now that I have a recorder with
direct line input, I find (no great surprise
I guess) that I can record from the line
output of the receiver and then get perfect
decoding at a later date when I play the
tape into the line input jack of the
computer.

Just to close out the record on that
experiment.

73,

Ed

W3NRG

585. [propnet] Heads UP BEACONeters

From: RickfordG@aol.com
Date: Sun, 25 Nov 2001 14:04:16 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48565-2001.11.25-13.32.28--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all
For the past week I have been trying to recruit new BEACONeters. I have recieved 3 answers from the 3 Australian officials.The results is below.

I tried working on Japan today but, it looks like a tough nut to crack do to the language barrier. Think I found an in direct rout. Ill keep the group posted.
Rich
WD4RBX

Hi Rick, thanks for your mail on the Beacon net idea, certainly not SPAM. Have passed it along to a couple of VK3's and an item will go into our APC News this week on air and the net.(attaching text) PSK was a big here recently but seems to have gone quiet, it has been swamped by IRLP at the moment
(Who said A/Radio was washed up with nothing left to do ?) Good luck with it all, cheers from OZ, Keith VK3JNB

Beacon net - Propagation study

An interesting request from Richard Georgina WD4RBX for VK stations to participate in a propagation study dropped on JNB's news desk recently, and Richard writes…

Greetings Keith, or should I day "Good Day"

My name is Richard WD4RBX, and I am looking for Amateur Radio operators that would be interested in participating in a propagation study. Our main HF band of operation is 10 meters. We operate two modes AX.25, 1200 baud on 28.128 USB and PSK31 on 28.131

If your club members would like to learn more, or think they might like to join "The BEACONet propagation Study" please deliver this E-mail to them.

I trust that your club does not find my E-mail as "Spam" If so, please contact me directly.   Thanking you, Richard WD4RBX

So let us know what you think during the call back should you be interested on this one, and we also have a couple of e-mail addresses to get in touch with the US guys.

Meantime you might also like to have a look on the BEACONet web site at http://go.to/BEACONet to see it all for yourself.

So why not leave the IRLP alone for a weekend and get back to PSK31, you might end up being part of amateur history.

(BEACONet founder, Ev Tupis w2ev@rochester.rr.com)
(Rich WD4RBX   rickfordg@aol.com)

(Rich WD4RBX / Keith VK3JNB)

Bob

I haven't used PINE is quite some time, but I though there was an option you
can set that will eliminate the header and just display the message. I
assume you are using this on a unix based system?

Forwarding this to the list as my Kornfuzer took a dump and locked up so bad
I had to actually power it off and back on to get WinBlows to load clean.

Rich

I spent 4 years living in Japan (7J1AUO) and I still have contact with a few English speaking hams who might be able to place this on their wire services.

Subject: [propnet] Heads UP BEACONeters

Hi all
For the past week I have been trying to recruit new BEACONeters. I have recieved 3 answers from the 3 Australian officials.The results is below.

I tried working on Japan today but, it looks like a tough nut to crack do to the language barrier. Think I found an in direct rout. Ill keep the group posted.
Rich
WD4RBX

Hi Rick, thanks for your mail on the Beacon net idea, certainly not SPAM.
Have passed it along to a couple of VK3's and an item will go into our APC News this week on air and the net.(attaching text) PSK was a big here recently but seems to have gone quiet, it has been swamped by IRLP at the moment
(Who said A/Radio was washed up with nothing left to do ?) Good luck with it all, cheers from OZ, Keith VK3JNB

Beacon net - Propagation study

An interesting request from Richard Georgina WD4RBX for VK stations to participate in a propagation study dropped on JNB's news desk recently, and Richard writes…

Greetings Keith, or should I day "Good Day"

My name is Richard WD4RBX, and I am looking for Amateur Radio operators that would be interested in participating in a propagation study. Our main HF band of operation is 10 meters. We operate two modes AX.25, 1200 baud on 28.128 USB and PSK31 on 28.131

If your club members would like to learn more, or think they might like to
join "The BEACONet propagation Study" please deliver this E-mail to them.

I trust that your club does not find my E-mail as "Spam" If so, please
contact me directly.   Thanking you, Richard WD4RBX

So let us know what you think during the call back should you be interested on this one, and we also have a couple of e-mail addresses to get in touch with the US guys.

Meantime you might also like to have a look on the BEACONet web site at   http://go.to/BEACONet to see it all for yourself.

So why not leave the IRLP alone for a weekend and get back to PSK31, you might end up being part of amateur history.

(BEACONet founder, Ev Tupis w2ev@rochester.rr.com)

Rendered body type: text/plain

I have worked out most of the bugs and have posted the updated version of 2
on the website. Use the link below. I still do not have a good help file
or readme, but I did incorporate some instruction to configuration on the
web page. Please read it carefully prior to downloading.

Sometime after the 7th of Dec I will be conducting an experiment using
version 2 to connect outside of the local host. I will need a few
volunteers. You need to have a full time IP address and I need to know this
address so I can configure you into the fire wall to allow access. If you
have a dialup connection, this will not work as your IP address is different
each time you connect to your ISP.

The idea is for someone on the east coast to connect to some on the west
coast and actually see what the west coast station is seeing. I will be
conducting this experiment with my radio connected to the 144.39 APRS LAN
here in Tucson. More details as I get this worked out. In the mean time I
will be brushing up for the 3 hour, math final I have coming up in a few
weeks.

Hi Jeff,

Have just been to the Version 2 web page but can't see your graphics. Is it
me or you? Would like to participate in your experiment for the local host
but since I'm running through a router connected to the cable modem don't
think it will work.

New features in the program look great and will get it installed shortly.

I have been watching Beaconet activity on 10 meters for the past few days
and
I think I would like to experiment a bit with it.
I have the UI and the psk31serv software installed. Everything works fine
and I have my interface mostly built.

My question is, I see u Guys give reports on received stations with some
software called
UI-mailer and UI-view snapshot reader.
Where can I get some info on these two pieces of software.

Tnx in advance.
Dane

Bob
try the web page now. That stupid html editor I use likes to add path
information that is not required. Found the problem and it should show the
graphics just fine.

As for the experiment if you have a standard IP address the is not of the
44,10,172 or 192 domain on your computer, then it should work fine as long
as you run me through the router.

There are no settings that I can find on the TAPR site to change
anything that you mention. It sounds suspiciously like your eMail
client that may need tweaking.

618. [propnet] UIMailer2 going bezirk....

From: "Kolb, Ramon" <ramon@ieee.org>
Date: Sun, 25 Nov 2001 23:40:14 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48647-2001.11.25-23.11.01--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

I have a big problem with UIMailer2:
as soon as I start it, it begins to spew reports... every second another one. It started when I changed my configuration from "UTC-5" to "UTC+5" and pressed "OK". I can't even open UIMailer anymore since it will begin spitting out emails every second and completely bog up the computer (not to mention the LYRIS server....)

When I was configuring it originally, I ran into a few other minor things:
- Hostname Lookup Timeout. Sorry, my dialup is very slow... I need at least 1 minute (2 would be even better) for this timer. I get this error when attempting to send an email via SMTP.

- some typos: "personal" in the tab name in the configuration screen
- "BEACONnet" should be "BEACONet" in the "about" box window title

That's it... if you can help me with the very first problem, that would be
great...

Thanks,

Ramon w1/pa3eug

Roman

What speed is this computer?

not sure what happened that caused this but try this exactly.

in run box from the start menu type regedit

find the following key: HKEY_CURRENT_USER and double click the tab

Find C: and double click the tab (or the dirve leter you installed to)

Find the directory you installed the mailer into and double click the tab

Find mailer2.exe and double click the tab

find Main and double click the tab

In the data window are all the registry setting that are stored from the
configuration page. You can either edit the UTCOffset back to -5 or if the
other setting look to be garbeged up, then delete each item and exit the
registry editor. You can restart the mailer and retype the configuration
entries. Remember you are playing with the registry. If you feel
uncomfortable doing this, then all you need to do is rename the directory
you have now to something else and launch the program.

I've got the typo corrected and that will be in the next release. I don;t
think I can do a 2 minute timeout with SMTP, but I will take a look at it.
IN the mean time use the MAPI as this will put the email in the out box and
allow the software to continue running.

Try using your email address as the address to send the emails to before
using the propnet address. Also watch the data window and tell me how may
connections to the SMTP server you get.

Jeff N7YG

. . .
>28132    3DJR                       Drift net beacon
. . .
```

I wonder if this is the source of some of the carriers we hear from
time-to-time. I don't really know what a Drift net beacon is, other
than probably some type of direction-finding apparattus to help
fisherman find these things, maybe?

Drift net beacons allow fishermen to recover nets they drop off to snag
fish. The Japanese and Russians are big drift net fishermen. Theres
generally two beacons, one on either end of the net. And yes, they have to
DF them to find them. Whats not unusual, is the beacon is this high in freq.
A quick search of the net shows multiple reports of beacons at 28.151 and
some in the 160 meter band as well.

Rendered body type: text/plain

This message for those who have labored over
the difference between CRC confirmed catches
and "open to all" catches.

This may not be what Ev would like the group to
be doing but I will bet that if we had software
that had a look up table of all active 28.131mh
PSK31srv BEACONetters calls, configuration
codes and grid locators and reported a good
"catch" if two out of three of these elements
were valid/verified in a specific catch, our reported
good catch rate would double or triple.

KF6XA and I have noticed in our Groundwave
propagation experiments that the order of
successful reports is something like:

    .grid locator - almost always

    .configuration code - somewhat less often

    .call letters - even less often

Dave figures that the secret here is that PSK31srv
has time to really settle down and decide to stay
with a signal by the time it gets as far as the
grid locator.

Also, comes back to my earlier wish for a way
to have a much longer "no info" preamble but
Ev says we can't do that.

For what it is worth.

73,

Ed

Jeff:
I appreciate your quick response to my request for help.
version 1.73 does not seem to be there when I try to follow to link
I am having trouble with ver. 2. My provider (Verizon DSL) keeps kicking me
out when I try to send email as I need to provide a password and I can not
locate a place to put one in. Any suggestions when you get time.

Yes you can have a much longer preamble. You should edit it directly into
psk31srv.ini, not via the config screen. Same for CW ID.

Hi, Ev,

That could well be the source of the steady
signal I hear at 28.131mh+1500kc.   If the
bouy is in the ocean out here, the frequency
would probably change with temperature
and that might explain why it starts out
below 1500 kc at night and then drifts
up to above 1500 kc during the daylight
hours.

Now, all we need to do is to convince a
fisherman to put one of George's warblers
into the bouy and we will finally have a station
out in the Pacific!!

73,

Ed

Dane,
Try the MAPI selection and see if that works. I will look at the password
process. I may have to change my SMTP control.

Version 1.73 should be located at home.earthlink.net/~n7yg/uimailer.htm

Jeff

Thanks for the input, Ramon. I'll keep that
in mind.

In the process of trying to install Mailer v2.0
I somehow corrupted my Mailer v1.7 so I cannot
send out a report for Monday the 26th.

Hopefully Jeff can give me some hints as to
how to get v1.7 working again so I can
be back with the daily reports today.

73,

Ed

637. [propnet] Responce from Austrillia

From: RickfordG@aol.com
Date: Mon, 26 Nov 2001 09:54:14 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48687-2001.11.26-09.22.36--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hi All

After hearing the APC News broadcast,  Paul VK2KZO dropped me a line wanting
information about BEACONet ;-)

Just heard from Dave VK5KK. He "copied it around our group to stir up some
interest!!" Quite a long list by the way.

It looks like the word has gone out in a big way around Australia.
Many thanks!
Rich

Hi All

You all are welcome ;-)  As free time presents it's self I plan to keep
plugging a way.

639. [propnet] TransAtlantic and TransPacific on 2-meters

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 27 Nov 2001 08:24:52 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48883-2001.11.27-07.54.36--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Brief history:
o The distance between Europe and North America is approximately
  3100 km and has never been spanned for full contact using all-
  amateur, terrestrial means, on the 2-meter Amateur band.

o The distance between the UK and EA8 is comparable and is likewise
  spanned sporadically by the same medium.

o The distance between California and Hawaii is comparable and is
  spanned sporadically in the late summer and early fall, by way
  of a tropospheric duct.
  - the "first signs" of such an opening often include one of two
    signal sources: KH6HME CW beacons (60-watts to 2x14 element
    yagi's [this information is from memory...treat it accordingly]),
    or FM voice repeaters (at altitude)
  - rarely (if ever) has the path been identified as "open" simply
    as a result of a QSO being "broken" by an amateur on one side
    of the path or the other (again, from personal memory).

Discussion:
Annecdotally, it appears that the KH6/W6 path has been successfully
traversed because of having a constant, high-ERP signal source (KH6HME)
at altitude aimed at the mainland and having people on the mainland
periodically listening for it. Once received, a telephone call is often
made to dispatch on operator to the KH6HME location (at some 14,000 ft)
to make contact. As the event builds, KH6's at lower altitude often
join-in as well.

This system seems to work for many reasons, including the following:
o The KH6HME beacon is a good neighbor. Although it is frequency-
  placed quite close (as a percent of frequency) to the SSB/CW sub-
  band, it is physically located on a remote mountaintop, using direc-
  tional antennas that point into the ocean. The potential to QRM
  other occupants of the 2-meter band is miniml, as a result of this
  special group of circumstances.

o The KH6HME beacon (located at a remote point) is "aimed" at the
  mainland, where there is a significant number of stations who take
  the time to listen for it.

o The KH6HME beacon operates 24/7/365. Anyone may dial-up the 'HME
  frequency at any time of the day to see if there is any propagation.

The system has it's challanges, too. The primary one is in the fact
that the receiving-end (W6) is human. Though I may be misinformed, I
know of no system that monitors 24/7/365. The "fact" that the path
opens only during mid-summer to early-fall is annecdotal. It just so
happens that this is the only time when it has been observed as being
open. Could it be that it opens at 2:00 am, in February, too?

Consider this information as we begin to focus our BEACONet.25 or
BEACONet^31 activity on the 2-meter Amateur band, in challanging for the
first TransAtlantic 2-meter contact. Let's also not forget that
BEACONet is more than a propagation-tracking tool. It can do more than
simply alert users to an open path; it is capable of actual 2-way
communication!

> signal sources: KH6HME CW beacons (60-watts to 2x14 element

Correction... I have found a website that says 60-watts to 2 x 7 element
yagi on 144.170 MHz. fyi.

Hi Jeff

This is my first attempt at Mailer2. I clicked "send to clip board" and this
is the results I get when I click "send mail." I like it a lot Just need to
figure out how to exclude my call. One can really pinpoint the action. Sorry
about all the junk but, I wanted you to see what went to the clip board.
Rich

642. [propnet] WX Radar Images for VK-BEACONet?

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 27 Nov 2001 10:00:10 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Cc: kb2scs@optonline.net
Message-ID: <LYR1548-48891-2001.11.27-09.29.49--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This was just floated on the APRS list. Why copy to BEACONet? Because
UI-View will check the map that you use every minute to see if it has
changed, and reload it if it has. This could be an interesting resource
for VK-BEACONet^31 (that's V=VHF, K=140-149.999 MHz) if we ever get it
established for a TransAtlantic attempt, eh? :o)

Ev, W2EV

Hi All
I have just finished programming. USWXRADAR. Which stands for United
States Weather Radar. As such this program is only of use for Hams
located in the USA.

USWXRADAR will go to the NOAA weather web site and download to the
users hard drive the Radar image that he or she has chosen.
It will be downloaded to the Sub directory that the user has chosen.
The radar image will be automatically downloaded every
10 or 20 or 30 or 40 or 50 or 60 minuets. User configurable.

USWXRADAR like all my other software is free. No charge.
You can download USWXRADAR at the following url
http://www.qsl.net/kb2scs

Let us hope we never witness the "Silence Of The Hams"

Rich,
Don't exclude your callsign. There is valuable information to gather by
having those statistics. For instance...I'm trying to correlate the TX
interval to how many catches a station gets. The original thought was
to find out "how much" is "too much" TXing.

Ev

644. [propnet] Use of capital characters or not ?

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Tue, 27 Nov 2001 17:37:05 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48911-2001.11.27-11.04.54--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all,
something to chew on:

"It is reminded that:

    * the PSK31 mode is designed to assure communications with ratio
Signal-to-Noise until   0.062 (-12 dB), so a signal 16 less powerful that
noise. The equivalent morse speed is 37   words/minute in capital and 51
words/minute in small letters (2.8 times PSK10 speed).

Note: these figures are available only in gaussian random noise (of 3KHz
band) but give an idea for real HF -and VHF) conditions (although,
unfortunately, others parameters influence the capacity to receive under
good
conditions...)."

Use capital characters or not ?

73 de JP

Hi Jeff,

Sorry I didn't reply sooner but got busy and my muli-track mind went in one
direction only! Web page now looks good.

Have had the program running a couple days now and seems to be working ok.
Have it sending me an update every hour at work plus sending to the list at
2359Z. Did have a problem last night with some error messages (I have
UI-View32 shutdown and restart with different transmission intervals at
1200Z/2200Z plus at 2359Z UI-View32 shuts down and cleans out BIN directory
to clear all the day's activity so have UIMailer2 watching PSK31Srv) but
cleared them before realizing they appeared to be from UIMailer2 - had the
antenna disconnected due to possibility of thunderstorms and thought maybe
I'd shut some of the software down on accident. I'll look more closely to
see what happens this evening. Am using the SMTP mode.

Here's the latest message I received at work (don't know why my xmit is at a
G for the 1600Z hour - shouldn't be more than 9 - 7 minute interval) --

Not sure what happend here, but it looks like you send out 16 transmission
that hour.

I think I have caught up on answering all the mail over the past 2 days. I did get a message from someone concerning connecting to SMTP and their server required a password. Thought I save that message, but I can not find it and I do not remember if I responded back to the issue. Whomever that was, please respond back to me as I need more information to see if I can solve this.

Hi Ev

I worked last night and I am sure that I did not make good sense this
morning. What I meant was all the (not sent to news group via Mailer2)
information that was sent to the clip board when I clicked send mail. All the
catches above the normal information that goes out to the news group is where
I would like to get rid of my call. * = get rid of.

> 00:38 WD4RBX>HY0G13-15:[EM84NM] *

Now I have a down to the minute log of the days activity without having to
dig through my beacons. I don't want to remove my info from the normal
mailing to the list.

651. [propnet] Need help with VK6DW

From: RickfordG@aol.com
Date: Tue, 27 Nov 2001 15:20:57 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-48946-2001.11.27-14.48.41--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all
Don wrote me a very interesting letter asking for information. I see a tremendous amount of Interest and potential here. There fore I would like to send him the best possible (detailed) advice. I was going to pass this one along to EV but, I am sure he has his hands full. I will keep the response that we put together and save it as a form letter that can be altered and sent to other inquires about BEACONet. If anyone wants to handle this one direct please send a copy to me.

I am working third shift so my brain dont.

Rich
WD4RBX

Subj: 28Mhz Propagation !!
Date: 11/27/01 10:36:45 Eastern Standard Time
From: <A HREF="mailto:donvk6dw@telstra.easymail.com.au">donvk6dw@telstra.easymail.com.au</A>
To: <A HREF="mailto:rickfordg@aol.com">rickfordg@aol.com</A>
File: DON001.JPG (90280 bytes) DL Time (49333 bps): < 1 minute
Sent from the Internet (Details)

Greetings Richard - my name is Don Hawksworth with the long term Callsign of VK6DW and have received your invitation to participate in 28Mhz propagation studies via E-mail info from Roy VK6XV who runs the VK6 Help Line here by VHF & HF Radio as well as E-mails -

I spend my time in retirement at the home QTH of Morley City in Perth Western Australia as well as at a Kalgan River Rural QTH about 10 miles east of Albany on the W.A. cooler South Coast where I spend most of the summer months and with my current activities could well participate in some 28Mhz propagation studies if you provide further details to me -

I am somewhat aware of the Beaconet activities through VHF Packet Bulletins and I can run the G4IDE UI-view32 program that is APRS compatible on HF and VHF here and have been monitoring 28.128Mhz SSB as well as 29.250FM on and off but with not much luck - Recently I have been monitoring 28,128Mhz for Pactor1 the during mid day lunch time here and the best so far has has been VK8 in Darwin with quite poor signals here in Perth just copyable on my trapped vertical antenna into a Kenwood TS-940S with the Pactor1 TNC - I also have a MFJ1278 that will run UIview on HF but need to make up the Radio Cables for it to go on HF - for Testing with these sort programs I mostly use my VK6DDS Callsign so that my other normal activities with VK6DW do not get crowded out, mixed up or crunched -

At my Kalgan River Albany QTH I have no Telephone Line for an ISP connection but can do Easymail E-mails with a Toshiba Laptop if I visit my Brother Ted who lives in the Albany City area - I also have a Kenwood TS-940S there & I work HF Pactor1 with the PacComm TNC that I bring with me but have no decent antenna for 28Mhz at present except a 27Mhz 3 element CB Yagi not on a high mast -
For good 28Mhz working I need to put up my Tri-band Yagi that is nearly ready to go but I have to repair a puncture in the rear tyre of my front end loader tractor before I can erect the mast & Yagi onto the concrete base - This project is on the agenda for the coming year 2002 summer months - I usually work VHF Packet at the Kalgan QTH & could run UI-view32 on 28.128Mhz SSB with an MFJ1270 TNC that I am currently running in Host Mode for testing

WinFBB with the Local Albany VHF Packet Sysop John VK6JY - I would need to
make up the TNC Radio cable for HF working with UIview32 on 28Mhz SSB -

At my Morley Home QTH I do have an ISP for Internet prepaid Access but only
use that for E-mails when the Telstra Easymail 250k size limit is to be
exceeded with attachments & the like and my ISP does not have country
facilities where as the Easymail can be used Australia wide for a Unit fee
phone call with no other charges and works very well -
The Attached JPEG was taken at the Kalgan QTH in the late 1990's by Bob VK6RW
on a Kodak digital camera & may be over exposed because he could not move far
enough away - in the meantime the computer & Radio Gear has been changed
around and I am currently using a Pentuim 133Mhz PC with a dual boot Win95 &
Linux Red Hat 6.0 along with a Panasonic CD Writer & a times 40 speed CD
reader - Roger Barker's Winpack is used for VHF Packet and UIview32 into
hardware TNC's - Best Wishes and 73 for now from Don VK6DW.....>>>>

Cliff,
Be sure to not delete yourself from reports. Without your information
shown, we don't know the point on earth from which the "catch" was
made. (ok...those of us who have been around know where you are...but
we get new folks all the time). :o)

> Use capital characters or not ?

Use capital letters in the preamble. Use lower case letters in the
payload wherever possible. A pure UI-View user may use lower-case only
for [gr##id], unless they manually edit the uiview.ini file.

The preamble exists only to get a lock. Once found, it is best to get
as much information through a in as short of a time as possible.

Jeff,
That was my letter and I must thank you for all the help.
I was able to get UI-Mailer 1.73 and that works just fine (tested it this
evening). But with version 2.0, Well here is the original message.

Jeff:
I appreciate your quick response to my request for help.
version 1.73 does not seem to be there when I try to follow to link
I am having trouble with ver. 2.0 My provider (Verizon DSL) keeps kicking
me
out when I try to send email as I need to provide a password and I can not
locate a place to put one in. Any suggestions when you get time.

Can't wait to get this whole thin up and running.
tnx agn
Dane (WI3X)

665. [propnet] uimailer 1.73

```
From: "Wayne Colliander" <wcolliander@earthlink.net>
Date: Tue, 27 Nov 2001 19:38:31 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49013-2001.11.27-22.08.04--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

As to the question if UIMailer works on a dialup, I just did it from mine and it works!
I will be sending reports often. I do not transmit ( TECH, working on learning code).
Wayne

Your positive outlook is always appreciated, Wayne! Best wishes on the
upgrade. It will be great to have another participant on "HY"!

Ev

The virus trap in our company Exchange server caught a Saphos worm
(Badtrans-B virus) attached to a message that originated on the propnet
list from W4ABC. Please check your machines to see if you have it and
don't know it.

Thanks!

Doug Wetzel

Thanks for the "heads up" Doug. Here's hoping W4ABC updates their virus
defs soon. :o)

I use Netscape eMail, and have configured it for text-only (no HTML) so
minimize such risk...however...I use the following "safety net": I have
an eMail address in my address book by the name of
"virustrap@update.virus.definitions.now". Of course, it is a bogus
eMail address. That means that if a worm attaches itself to my eMail
address book, it will send an eMail message that will bounce back to
me...warning me to take action.

So far, it's never had to...thankfully. :o)

Ev, W2EV

676. [propnet] Virus update

From: blitz <blitz@macronet.net>
Date: Thu, 29 Nov 2001 03:31:21 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49192-2001.11.29-02.59.12--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Yes, Indeed there is a infection of W32.Badtrans.B@mm going around.

I've discovered it in a file called HAMSTER.DOC.pif (this is chosen from a
random list of filenames, please note the three parts to the filename) and
Norton does indeed find it.
The file is being located elsewhere in your email program than where you
store your attachments as well. A scan of my attaches in eudora produced
nothing, but a full scan produced the file living in c:\eudora\embedded

What does this mean? It means the file is being transmitted IN the web
page, and NOT as an attachment. (at least in my case) This is most often
the case when an email contains a picture or other HTML compliant text, so
a email containing an embedded picture can be a vector of this.

Relevant data here:
http://securityresponse.symantec.com/avcenter/venc/data/w32.badtrans.b@mm.html

Norton just raised the threat level from a 3 to a 4. However, containment
and removal is easy.

Any Norton Antivirus with a virus definition base newer than Nov 24, 2001
SHOULD detect it. This is not always the case, by my own observations. I've
had fresh anti-virus files weekly, and found a copy of it here. However,
since I do not use MS email products, it never went off. A scan detected
it, and gave me the hamster.doc.pif filename.

Keylogger payload:
W32.Badtrans.B@mm is a MAPI worm that emails itself out using different
file names. It also
creates the file \Windows\System\Kdll.dll. It uses functions from this file
to log keystrokes.
I suggest at the very minimum, you do a search NOW for that filename on
your computer.
THAT is the most dangerous part of this worm, the keylogger.

WARNING! THIS COULD COMPROMISE PASSWORDS AND YOUR PGP CRYPTO SYSTEM!! WARNING!

How it works:
This worm arrives as an email with one of several attachment names and a
combination of two
appended extensions. It contains a set of bits that
control its behavior:

001 Log every window text
002 Encrypt keylog
004 Send log file to one of its addresses
008 Send cached passwords
010 Shut down at specified time
020 Use copyname as registry name (else kernel32)
040 Use kernel32.exe as copyname
080 Use current filename as copypath (skips 100 check)
100 Copy to %system% (else copy to %windows%)

When it is first executed, it copies itself to
%System% or %Windows% as Kernel32.exe, based
on the control bits. Then it registers itself as a
service process (Windows 9x/Me only). It creates
the key log file %System%\Cp_25389.nls and drops
%System%\Kdll.dll which contains the key
logging code.

NOTE: %Windows% and %System% are variables. The worm
locates the \Windows folder (by
default this is C:\Windows or C:\Winnt) or the
\System folder (by default this is
C:\Windows\System or C:\Winnt\System32) and copies
itself to that location.

A timer is used to examine the currently open window
once per second, and to check for a
window title that contains any of the following as
the first three characters:

LOG
PAS
REM
CON
TER
NET

These texts form the start of the words LOGon,
PASsword, REMote, CONnection, TERminal,
NETwork. There are also Russian versions of these
same words in the list. If any of these words
are found, then the key logging is enabled for 60
seconds. Every 30 seconds, the log file and the
cached passwords are sent to one of these addresses
or some others which are currently not
operational:

ZVDOHYIK@yahoo.com
udtzqccc@yahoo.com
DTCELACB@yahoo.com
I1MCH2TH@yahoo.com

WPADJQ12@yahoo.com
smr@eurosport.com
bgnd2@canada.com
muwripa@fairesuivre.com
eccles@ballsy.net
S_Mentis@mail-x-change.com
YJPFJTGZ@excite.com
JGQZCD@excite.com
XHZJ3@excite.com
OZUNYLRL@excite.com
tsnlqd@excite.com
cxkawog@krovatka.net
ssdn@myrealbox.com

After 20 seconds, the worm will shut down if the appropriate control bit is set.

If RAS support is present on the computer, then the worm will wait for an active RAS connection. When one is made, with a 33% chance, the worm will search for email addresses in *.ht* and *.asp in %Personal% and Internet Explorer %Cache%. If it finds addresses in these files, then it will send mail to those addresses using the victim's SMTP server. If this server is unavailable the worm will choose from a list of its own. The attachment name will be one of the following:

Pics
images
README
New_Napster_Site
news_doc
HAMSTER
YOU_are_FAT!
stuff
SETUP
Card
Me_nude
Sorry_about_yesterday
info
docs
Humor
fun

In all cases, MAPI will also be used to find unread mail to which the worm will reply. The subject will be "Re:". In that case, the attachment name will be one of the following:

PICS
IMAGES
README
New_Napster_Site
NEWS_DOC
HAMSTER
YOU_ARE_FAT!
SEARCHURL
SETUP
CARD
ME_NUDE
Sorry_about_yesterday
S3MSONG
DOCS
HUMOR
FUN

In all cases, the worm will append two extensions. The first will be one of the following:

.doc
.mp3
.zip

The second extension that is appended to the file name is one of the following:

.pif
.scr

The resulting file name would look similar to CARD.Doc.pif or NEWS_DOC.mp3.scr.

If SMTP information can be found on the computer, then it will be used for the From: field.
Otherwise, the From: field will be one of these:

"Mary L. Adams" <mary@c-com.net>
"Monika Prado" <monika@telia.com>
"Support" <support@cyberramp.net>
" Admin" <admin@gte.net>
" Administrator" <administrator@border.net>
"JESSICA BENAVIDES" <jessica@aol.com>
"Joanna" <joanna@mail.utexas.edu>
"Mon S" <spiderroll@hotmail.com>
"Linda" <lgonzal@hotmail.com>
" Andy" <andy@hweb-media.com>
"Kelly Andersen" <Gravity49@aol.com>
"Tina" <tina0828@yahoo.com>
"Rita Tulliani" <powerpuff@videotron.ca>
"JUDY" <JUJUB271@AOL.COM>
" Anna" <aizzo@home.com>

Email messages use the malformed MIME exploit to allow the attachment to execute in Microsoft Outlook without prompting. For information on this, go to:

http://www.microsoft.com/technet/security/bulletin/MS01-020.asp

The worm writes email addresses to the %System%\Protocol.dll file to prevent multiple emails to the same person. Additionally, the sender's email address will have the "_" character prepended to it, to prevent replying to infected mails to warn the sender (eg user@website.com becomes _user@website.com).

After sending mail, the worm adds the value

Kernel32   kernel32.exe

to the registry key

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\RunOnce

This will run the worm the next time that you start Windows.

Removal instructions:

To remove this worm, follow the instructions for your operating system.

Basic instructions

Windows 95/98/Me
1. Restart Windows in Safe Mode
2. Run Norton AntiVirus and delete all files that are detected as W32.Badtrans.B@mm.
3. Remove the value that it added to the registry.

Too bad we're not already active on the TransAtlantic attempt on
2-meters. There's an interesting opportunity developing from the
Carolina's to Florida. Look at the attached hyperlink:

http://www.iprimus.ca/%7Ehepburnw/tropo_nat.html

Hi Dane,

I don't remember having seen you before. Welcome !!

Looks like I am in the dead zone from you... don't see my callsign in your
list and I don't see your call in my lists that I am getting here every
other hour.

Again, welcome to the club,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

Thanks Ramon:
A few things abt my setup which I am just gettin going and won't be in full
swing for a few more weeks.
      1.) My two element beam does not have a rotor and is pointed such as
you are most likely in the null.

      2.) I switched to a 25W. radio shack 10m rig so I can use my 746
while transmitting Beaconet stuff.

      3.) I only made a few transmissions today, till I get the interface
for the rig built and the omni 10m ant up so I can let this thing run
24/7.

Thanks for the welcome.
CUL

689. [propnet] Computer clock losing time

```
From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Thu, 29 Nov 2001 14:18:49 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49268-2001.11.29-16.46.38--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

```
Hello all,

I run BEACONet on a Fujitsu Lifebook laptop, 150MHz processor, running
Win98.  This machine is not usually connected to my local network or to the
Internet, so there is no provision to update its clock regularly. I've
noticed that while the programs are active, the computer clock loses about
```

one minute per hour.

I was pretty sure my computer doesn't lose time ordinarily. To be sure, I ended UIView and PSK31SRV last night, and it didn't lose any time overnight. From 7am to noon local, it lost about 4.5 minutes.

I wonder if anyone else has noticed this problem. I think it might possibly be happening just as the system goes to transmit. The psk31srv screen changes from green characters to yellow, and then there is about a three-second pause before the transmitter comes on. The few times I had the clock-adjust screen up at this moment, it seemed to hesitate. At 12 transmissions per hour, a four-second clock stoppage per transmission would just about explain it.

73

Dave

```
> I've noticed that while the programs are active, the
> computer clock loses about one minute per hour.

Hi Dave,
Try this and report back, would you? This would be interesting to a lot
of folks...really.

Boot your computer fresh and assure the clock is WWV set.  Let it run
for 24 hours and check the clock again.  Not how far off from WWV time
it is.

-then-

Reboot your computer.  When your booting ends, check the clock again and
see how far off the time is from WWV.

Then...read this...
http://jasper.he.net/~beagle/mainfaqclock.htm

It has a complete discussion on the topic of BIOS vs OS clocks.  A good
resource.

Ev, W2EV

Hi Dane!  Welcome aboard!  It's good to have Pa on the map!  You'll have
to keep an ear out on 147.585 during the January VHF Sweepstakes.  There
should be more than one Rocester NY rover make their way to your area
with mobile trackers running.

```

I have seen it happen enough to report that the computer clock stops, for about four seconds, each time that PSK31SRV goes into Transmit mode. The screen characters change to yellow and TX START is displayed; the clock freezes; about four seconds later it restarts, the transmitter is keyed, and the message is transmitted.

In fact, I'd guess that _everything_ stops. The waterfall certainly appears to stop.

Again, this computer is running Win98. I do not have the same problem when running on NT 4.0

Which one, Dave? The OS clock, the BIOS clock or the RTClock?

Hi. I just started monitoring, and will be sending from my location in Mass
today. I probably won't be as regular as some of the others, but am
enjoying this -- great idea.

Just wondering . . . does anyone still use packet rather than PSK31 on 10M?
Given how critical the tuning is and the greater distance for signal
strength performance of PSK, I assume everyone has migrated to PSK31 for
Beaconet on 10M band(?)

73,

Joe, KB1CJ

Hi Joe,
AX.25 (BEACONet.25) is alive and well on 28.128 USB at 1200 baud. I'm
glad that you have an interest in it...as it enjoys many advantages over
BEACONet^31, actually.

Please...tune-up and let it run for a while.

It's good to have you on-board!
Ev, W2EV

Just wanted to let everyone know that my rig will be running in the monitor
only mode today.  My dipole is caked with ice and the SWR is through the
roof!  Hopefully, by tonight temperatures will have returned to "normal" and
I can poke the transmitt button.

Bob - KC5DUI

Dave

I think this is a memory problem. How much memory do you have installed? I
have found that Win98 needs at least 64 meg to run without a lot of swap
file action and 16-64 more depending on how may program you have running at
the same time. I experienced this same problem a while back with other
software with only 64 meg.

It appears that the clock is suffering from the lack of resources when
PSKsrv goes into xmit.

Those who are having difficulty getting version 2 to connect to UI-View on port 1448, please ensure you have the local APRS server enabled. In uiview select the APRS server setup page and select Enable Local Server. This should do the trick.I will include this in the instructions for further updates.

Hi Joe,

I have been hearing you regularly today but with mixed results. The signal is strong enough, but somehow I am not getting anywhere near an errorless copy of you. I'm located on the Allston/Brighton line, in Boston.

Also, please make sure you have both CRC options selected in the PSK31Srv

configuration menu. If you don't add CRC, most of us won't copy you onto our screen. We did that in order to avoid "ghost" copies in our lists.

As for AX.25 beaconet, yes I know that there are still a few good men out there. But I think most of the activity is in PSK31....

Please find attached my latest station heard list, to give you an idea what a "regular" day can bring you.

Thanks,

--Ramon W1/PA3EUG, Boston, MA, USA [FN42KI]

1. [propnet] Clock, again

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Fri, 30 Nov 2001 22:14:15 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49466-2001.12.01-00.42.20--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

When I said I could see the "clock stop", I meant that I had the Adjust
Clock screen up, and I could see the "clock" stop. You get this screen by
right-clicking on the time in the task tray, and selecting Adjust Date/Time.

The visible clock is just a manifestation of the OS clock. The OS clock is
a VERY low level and quite small routine. It ticks .... let me see, is it
18.3 times a second or every 18.3 ms, I forget ... but for the tick to be
missed indicates interrupts are totally masked off for a very long time.

I'm guessing this has to do with serial port handling by psk31srv, and is
probably something peculiar to the BIOS in this computer, as no one else
has mentioned observing the same thing.

As I'm not usually reporting my catches, this anomaly is only annoying. I
have another Fujitsu notebook, only running Win95 instead of 98, and I'll
try it soon to see if it does the same thing.

Rendered body type: text/plain

Hi,

seems I am having some antenna tuner problems, making my SWR vary greatly. In
addition, I need to check my power cable for a bad contact. All this made my
station a little "irregular" the last few days.

Anyone has a good working spare tuner lying around they want to sell? Thought
I'd ask here before going to eBay...

Thanks,

--Ramon W1/PA3EUG

A-ha!...

> When I said I could see the "clock stop", I meant that I had the Adjust
> Clock screen up, and I could see the "clock" stop.

As Dave so aptly mentioned, our biggest culprit is "The OS Clock". It's
a software-based clock, built into Windows that almost all applications
use for time-control.

I'm going to float an idea that I've floated to others (on other lists)
before, but have never gotten any nibbles on. Let's see if the ol'
BEACONet Inspiration Network is willing to give it a go. :o)

Here's my premise:
o The OS clock loses time as the computer runs without reboot.
o The Real Time Clock (the hardware clock inside the computer, that
  the OS checks and sets itself to upon each boot-up) is stable.

Wouldn't it be cool for someone to write a small piece of software that
could be setup to resyncronize the OS clock to the RTC every n-minutes,
without the need to reboot?

This would solve a *lot* of other problems, like "clock creep" during
meteor shower use of UI-View Meteor Mode!

Of course, the assumption is that the RTC is stable. We should run some
tests to find out before someone goes to the trouble of writing a
clock-sync routine. Here's how to test:

o Boot your computer and sync your clock with WWV. When you
  set your Control Panel clock, it pushes the time to the RTC.
o Note the time that WWV sync was done.
o Let your computer run for a few hours and come back to check
  the Control Panel clock again...noting the amount of time that
  has passed since the original WWV sync-ing was done. This will
  give you a "slip rate" (how many seconds it loses each hour)
  for your OS.
o Without resetting the Control Panel clock, shut down and reboot
  your computer. When it is fully booted, check the time again.
  The Control Panel clock will have re-sync'd with the R-T Clock
  upon reboot. Compare it to WWV. This will tell you how
  accurate your Real Time Clock is at keeping time.
o Report the results.

Why is this important? Because BEACONet (among other uses) can study
propagation in real time. Our data gets skewed if time keeping is
inaccurate. While this is no big deal to the casual operator, who may
shut-down each night, it's possible that a clock could be off by an hour
or more after several days of continuous operation.

Ev, W2EV

7. [propnet] BeacoNet31 2m in Europe

From: "J-Philippe F5SMZ" <f5smz@gmx.fr>
Date: Sat, 1 Dec 2001 16:47:10 +0100
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49516-2001.12.01-10.17.32--lyris.propnet#tapr.org@lists.tapr.org>

Rendered body type: text/plain

Hi all,
just to let you know that the propmotion of a european wide BeacoNet31 beacon network is on going. I have started to "negotiate" and evangelize the implementation of the system on VHF bands.

Currently I'm in the setup of the first VHF BeacoNet station operating PSK31 on 2m (mine, Hi). As I need to make major changes at my home to put on air this beacon I will need to stop tranmitting permanently on 28.131 to be able to work in a comfortable manner.
Once done, my 28.131 beacon will be as usual 24/24 up and running. As I'm talking of HF, is some of us interseted BeacoNeting on 10.131 PSK31? Let me know.

I hope that my coming QRT periods will not impact the staudy we are all doing, because as I can see, it seems that I'm the only one transmitting continuously in Europe.

Ev and the group, if you prefer I stay beaconing permanently, I will postpone my modifications here and put on air the 2m station later. Let me know.

Transatlantic issue:
We have discussed a lot about the experiments in the coming summer 2002. Now many hams in France are aware og our projects, especially F6ETI sysop of the beacon F5XAR in IN87 (transatlantic beacon). He is now convinced that only an automated system like BeacoNet could one day probe and log some propagations anomaly between us.
I'm invited to officially present and introduce BeacoNet and BeacoNet31 VHF Europe at CJ2002 on 14-15 April 2002, Annual French VHF Meeting.

Starting BeacoNet31 VHF in Europe:
Also, I have started to request one frequency by VHF band in order to have a federating point for hams wanting to join us here in VHF.
An article about BeacoNet in the french radioamateur magazine is planned for beginning of next year.
Tomorrow, I will be at AMTEC German Radioamateur Meeting to promote the project (not far from my QRA, only 40kms !)

Misc:
I keep working on the online reporting system (remember, the Applet templates I posted some days ago).

What a busy end of year 2001 !!!!!!!!!!   :)
Hope, all this stuff sounds good to you.

Roman
I think I still have an old AEA AT-300 tuner around here That I can let go.
Let me see If I can find it. Think it might be in the closet where the XYL is storing (hiding) the Xmas goodies. I'll get back to you.

Subject: [propnet] antenna tuner problems

Hi,

seems I am having some antenna tuner problems, making my SWR vary greatly.

In
addition, I need to check my power cable for a bad contact. All this made my
station a little "irregular" the last few days.

Anyone has a good working spare tuner lying around they want to sell?
Thought
I'd ask here before going to eBay...

Thanks,

--Ramon W1/PA3EUG

Hi JP,

although I really support your efforts for VHF Beaconet, I would hate to see us lose the only European station that it active on 28.131 at the moment. Would there be any way you could combine these efforts, for example to run 2 meter experiments when the 10 meter band is closed to the US (before 13:00 MET or after 20:00 MET)?

If not, well, I will continue to work to analyse the data that I already have, and I am writing an article on propagation between you and me meant for publication. When it's done, we should think about co-publishing it in QST and in the REF magazine.

Hope you can stay on at 10 meters,

--Ramon w1/pa3eug

Rendered body type: text/plain

Hello group,
I'm seeing bits and pieces of Ramon (Mass to NY is quite a short path)
today.

Also...I'm working on a supersimplified BEACONet^31 installation guide
for posting on a new website that I'm around 30-days from publishing.
 With all of the interest on ^31, I thought I'd feature it more
prominently on a new-look website.

I'll be including a downloadable INI file for both PSK31srv and UIView
that will have much of the "standard" configuration issues already
addressed, letting participants simply customize for their particular
station. The new instructions and .INI files seem to work well. I
tried them this morning with only a couple of small problems, that I'll
fix momentarily.

Just keeping you informed of my efforts. :o)

Ev, W2EV

Hi Ramon,
don't worry, I can cope with the simultaneous installation of the 2m beacon
and let running the 10m station. It was only, because it's more comfortable
for me. I will do the best as I can but I WANT to stay 24/24 active on 10m
for the group, project and the propo study you are curently making.
Congratulations for the article on prop reports between you and me, it's
really interesting according to what I've seen some days ago with the draft
XLS and Powerpoint examples... your english is 100x better than mine!
The results, as you propose couls also be published in Radio-REF in
France.

So, I understand the message "stay 24/24 on 10m, but setup the 2m BeacoNet
station when possible and there is no impact on 10m" You are completely
right Ramon. :)

Hi JP,
I'd hate to lose you as our only European on 10-meters. It's been
fascinating to watch how propagation between Europe and NA has changed
over the past few months. I'd like to talk a bit about the
transatlantic 2-meter attempt a bit more, too. Maybe all we need is a
"one way" system, with stations on one side of the Atlantic pumping
signals to the other side, without stations on the other side replying
with RF? That's how the KH6 beacon system operates...maybe they have
something there. I'd like to open this point for discussion more, though.

No matter what...it would be a shame to lose you on 10-meters.

Ev

OK OK Ev,
dont't worry, it was only for 2 or 3 days in a week, but as I told to Ramon
in another message I can cope with and I will STAY 24/24 on 28.131.

For Transatlantic experiments, I'm really interested in the concept of a
1-way system, when you have more infos, just let us know Ev.

Hi JP,
Based on re-reading your eMail, I'm starting to think that it *is* best
to have stations on both sides of the Atlantic transmitting. It would
be quite a coup if your efforts could land the project on a common
frequency on both sides of the Atlantic.

Thank you -- sincerely -- for your efforts. I think that F6ETI is
right. A BEACONet-like system is best positioned to catch an anomolous
event when it occurs.

Well done!
Ev, W2EV

Thank you, JP. I'm not sure why people seem to prefer PSK31, but they
do. I'll keep focusing more in that area. Best wishes, Ev.

Ok Ev,
2 way is not a lot additional work for the project. Just to tell you that
F6ETI is also the French VHF Manager in the IARU commitee, so a key guy,
that need to be convinced of the POWER of BeacoNet. He agreed that TRX
automation is logging is far more usefull that Fire and Forget CW !
For the common frequency issue, everybody has agreed that beacon sub-band
isn't the same in USA and Europe, but we need to find a COMMON freq for the
transatlantic experiments. I think things are going better and better
here.

Now, thought of the day:
"For the next BeacoNet Convention in USA I will be pleased to attend" :)

Cool.... I'm wondering what the algorithm is for the Psychic Prediction
routines :-)

(*just joking*)

23. [propnet] my station...

```
From: Ramon Kolb <ramon.kolb@usa.net>
Date: 1 Dec 2001 14:00:53 EST
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>

Rendered body type: text/plain

Hi guys,

just a short update on my station.

I am having two problems, one of which I "kinda" resolved. First, after so
```

much continuous operation, the contacts on the power plug of my IC735 seem to
oxidizing. Not good, but I guess a little contact spray will help. I'll visit
Radio Shack lateron today :-)
The second problem is my tuner. Similar problem, but worse. The band selector
switch is bust. I guess the "common" sliding connection first got oxidated,
and then started sparking. As a result, the connection is burned out. The
solution was going to the roof, removing the 15 and 20 meter elements from my
Hustler, and retuning the antenna with only the 10 meter element connected
until an acceptable SWR was reached. I tuned with about 5 Watts (the lowest
level I can make) on 28.135, so if you heard an empty carrier there earlier
today, it was me... Actually this is a pretty good solution since I can run
now without (lossy) ATU, but it also means that I am restricted in operation
to the lower end of the 10 meter band for now.

I noticed another pecularity. My ALC level seems to be related to my output
power. If I "tune" the ALC to be fine while transmitting at maximum power
(around 75 Watt...), the ALC is a limiting a lot more when I turn down the RF
power to a lower level. Weird... must be related to the IC735 design.

Anyways, I am up and running again and I'm hearing a lot of stations.

73s,

Ramon w1/pa3eug

Rendered body type: text/plain

We recently passed 10,000 hits on the website.  Not bad for being a
2-year old site. :o)

Check out the new "left panel" on the main page.  It's all about
encouraging ^31.  My hope is that it will be seen as simpler and easier
for folks.  The latest version of PSK31srv and UI-View/16 are featured,
along with BEACONet^31 specific .INI files.

If you are using the 16-bit version of UI-View, but haven't upgraded to
2.38 or are using a version of PSK31srv less than 1.08, then you may
want to consider *fully* uninstalling both and re-installing by
following the system shown on the web page.  NOTE: full uninstallation
of UI-View required manual deletion of \uiview folder after executing
the uninstallation routine.

Take a look!  http://go.to/BEACONet
Ev, W2EV

34. [propnet] More clock comments

From: Dave Donnelly KF6XA <kf6xa@qsl.net>
Date: Sat, 01 Dec 2001 23:10:26 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49671-2001.12.02-01.38.52--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Ev,

In my experience, RTC clocks are very accurate and stable. I run TimeLord to resync to an online clock. I used to do this daily, but found that over a week there wasn't more than 1.5 seconds error, which frankly is about the limit of accuracy of these systems, since they try to guess how long the delay between themselves and the time server is.

I'll bet that the program you suggested (to set the OS clock to the RTC clock) exists already. In DOS, it's about a fifty-line assembler program. Probably five hundred in Windows. The program itself could do the recurrent settings, or a scheduler program could kick off the reset program every once in a while.

I rebooted the Fujitsu notebook, and the clock-stopping-problem WENT AWAY. It's been right on, all day long today. Harumph.

The suggestion about memory provoked me to see how much was in that machine ... only 32Mb. Since this computer is now three years old, I feared it used some now-obsolete type of memory, but happily I found 64Mb more was available (new!) for $18. Isn't technology wonderful? I ordered it.

And completely off the subject, your signal was the loudest I have ever heard it all day long. I received it until 1640 local, which is just a little before sunset. The other "usual suspects" had disappeared at least 90 minutes earlier.

> In my experience, RTC clocks are very accurate and stable.

Yes, I agree. I actually ran the experiment suggested earlier and found that the RTC lost less than a second in 9-hours (and that could simply be observation error on my part), yet the OS lost 6-seconds. While this isn't that big of a deal to "normal" operation, this would drop me half-way back into someone elses meteor mode time-slot during a meteor event. Not good. :o)

> I'll bet that the program you suggested (to set the OS clock

I'd think so too, but I haven't found one. Something close appears at
http://www.rightime.com but it seems like severe overkill (plus, it
doesn't mention Windows NT/2K/XP, which is what I'm now running. I'll
keep searching, though.

        Well, don't forget that UI-View gives you two options for setting
the time. First, UI-View32 has an internet time-setting program built in,
and second, you can connect a GPS and continuously set the time from the GPS.

I synched my clock yesterday, right after I read your email, Ev. I showed
no change at all in my clock in the corner this morning. I'll continue
watching it to see if it changes over the next few days.
 Oh, by the way. I like the layout on your website. It is seems pretty
straight forward, even to a computer illiterate like me. :)

38. [propnet] New Interference This Morning

From: esack <esack@pacbell.net>
Date: Sun, 02 Dec 2001 07:38:35 -0800
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49699-2001.12.02-10.02.01--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I don't know if anyone else is seeing it but for the first time
I am seeing a very intense curtain of interference on 28.131mh
from +1500 to +2500 hertz audio on the waterfall.

The interference is a constant intensity set of 22 or so bars
of equal intensity [hence 1000 cps/22 = (aprox) 45 cps]
wide with almost no separation between them.

Given THIS neighborhood, they well could be local
QRM but I wonder if anyone is seeing that curtain
outside of the San Diego area.

Unlike some earlier reported "interference"
like last week's CW contest, this curtain
is strong enough to prevent a good copy
on even the strongest BEACONet signals
that happen to be higher than 1500 cps.

Seems to me, Ev, that the answer for the PSK31 preference
is the "theoretical" bang for the buck. I say "theoretical"
because we really still need to complete some well
controlled A versus B experiments. I know that
some have set out to do the work but do not recall
a conclusive report yet??

Sans a couple of cables, KF6XA and I have intentions
to make that comparison on ground wave some time
but other matters have interfered.

I'm not sure if it was the same thing or not, but earlier this morning I was
suffering from someone on voice. Sounded like spanish, so I have no clue
what it was. They consistantly broke up f5smz from coming through. It's gone
now.

Hi, Rich,

 I could be funny and say that with your usually strong signal (even on very
low power) it was an "echo from the past."

However, my UI-Mailer report shows one hit at 1905 UTC which, if I am not
completely off on my world time, was 1105 Friday morning
California time.

I don't think that UI-Mailer v1.73 which I am currently using
"holds previous days over" but I do recall at least one
E-mail from Jeff on the subject.

Maybe Jeff could comment further.

I do not think that is local to you. I see it here in Tucson from time to
time. I am seeing some junk down around 300hz but it does not seem to be
interfering with anything. PSK is pretty forgiving and not only a great
weak signal mode, but hold it own during interference.

Jeff N7YG

Same here in Boston. It's fading in and out a little, but it sounds like an
old-days "woodpecker" :-)

It's strong enough to make psk31srv stop at the indiviual component, which on
itself makes scanning a very slow job. It's not crossmodulation from some
strong nearby station, I checked, no stations are strong enough to make this
happen.

Oh, well, it's all part of the game, I guess... hopefully it will go away
soon.

Speaking of setting the clock, the utility mentioned below sure
looks interesting, if nothing else! <G>

         Seriously, it's FREEware, I just downloaded it, and it has a lot

of neat functions. Including setting your computers clock.

>01. STATBAR. This freeware program at http://www.statbar.nl/ offers a
>quick overview of your system's condition (memory, CPU, uptime, and
>more.) It provides modules in all-Visual Basic (no external 3rd party
>files) to show battery status, CD door eject/close, CPU usage,. exit/lock
>buttons, hard disk information, locks status, master volume control,
>memory status, RC5/OGR counter, time synchronization, Winamp controls,
>Windows uptime, and Windows version. There are a number of configuration
>options as well.

Rendered body type: text/plain

Over the past few days I have worked on answering some the suggestion and
recommendations. I have also rewritten the SMTP handler in hopes it will
cure some of the problem many are having with a dial-up account.

Here as some of the changes.

- wrote a new SMTP handler that includes the ability to add your account
password (Verizon)
- Added a routine to save the stationgrid to a CSV type file, compatible
with most spreadsheets, at the 235959 time tick.
- fixed a bug that overwrites the existing file when the mail method
selected is file and there is more than 1 hour selected in the scheduler.
-clears the data window prior to creating the mail message when the
clipboard method is selected.
- added a 4 minute timeout to the SMTP handler for 's l o w' ISP
connections.
- cleaned up some code for efficiency

I do not have the ability to test dial-up type connections so I must rely on
those who do to properly test this software. Your patients while I perfect
the code is most appreciated, thanks.

Version 1.73 is still available and I will be making some changes to that
version over the next week.

The difference between 1.73 and version 2 is the method used to obtain the
data. 1.73 relies on the snapshot routine within UI-View. The more
snapshots the more data. This method, although unique, is a bit flawed.
Even though propagation between you and the other station has gone away,
UI-View still retains the plot of that station on the map for a period of
time determined by your retention setting in the configuration files.
Snapshots are built upon the data present on the map at the time of the
snapshot and is appended to the daily snapshot file. 1.73 reads the
snapshot file chops out the required data and determines a first heard and
last heard time.

Version 2.x is much different in the way data is procured. An internet
connections is established between the Mailer program and UI-View or PSKsrv.
Please note that Ui-View MUST be setup to function as an APRS server. This
can be enabled on the APRS server setup page. PSKSrv is already designed as
an APRS server. APRS servers basically relay the data they acquire out to
the internet TCP port. Any client that is connected to the APRS server then
receives that data. The mailer receives real-time data packets and stores
that information for a 24 hour period or until you shutdown.

Here is the web site for the Dimension 4 software that I use to keep my
clock synced. It's free and connects to the many NNTP type time servers
around the world. Can be setup to only check the servers when you are
online. Great for dialup accounts.

This proves once again that the BEACONet concept is good...but at VHF
and above, it *requires* that the network be built mostly of hubs at
altitude...while the rest of us simply observe what they do.
 BEACONet.25 on VHF won't catch on until we start establishing a few. :o(

Until then, we can still watch the APRS network (at least if we're in a
low-traffic area of the country).

I have a dream... :o)

59. [propnet] HY-BEACONet.25 and Hx-BEACONet^31

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sun, 02 Dec 2001 15:53:35 -0500
To: "TAPR BEACONet/PropNET Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-49762-2001.12.02-15.23.28--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I get quite a few questions about BEACONet operation, now that 10-meters
is "hopping hot". One of the most frequently asked questions is about
our choice of frequency (28.128 and 28.131), and why it isn't in the
28.2 to 28.3 MHz range, which is the sub-band for "automatically
controlled beacons" in the USA.

The answer is simple: the "BEACON" in BEACONet does not refer to being a
"Part 97 Beacon". Instead, visit: http://www.m-w.com/dictionary (that's
Miriam Webster's Online) and type-in the word "beacon". See... "3 : a
source of light or inspiration ". BEACONet-ers regularly unshackle
themselves from conventional wisdom by virtue of what we do.

The BEACONet service is best aligned with Part 97.221, which reads...

- -

Sec. 97.221 Automatically controlled digital station.

    (a) This rule section does not apply to an auxiliary station, a
beacon station, a repeater station, an earth station, a space station,
or a space telecommand station.
    (b) A station may be automatically controlled while transmitting a
RTTY or data emission on the 6 m or shorter wavelength bands, and on
the 28.120-28.189 MHz, 24.925-24.930 MHz, 21.090-21.100 MHz,
18.105-18.110 MHz, 14.0950-14.0995 MHz, 14.1005-14.112 MHz, 10.140-
10.150 MHz, 7.100-7.105 MHz, or 3.620-3.635 MHz segments.

- -

As such, we're using 28.131 MHz. HOWEVER...it is time to begin thinking
about spreading out to the use of other HF frequencies in the future.
As one can see, there isn't much real-estate for BEACONet operation on
the other bands:

12 meters 24.925-24.930 MHz   5-kHz Total
15 meters 21.090-21.100 MHz 10-kHz Total
17 meters 18.105-18.110 MHz   5-kHz Total
20 meters 14.0950-14.0995 MHz, 14.1005-14.112 MHz <17-kHz Total
30 meters 10.140-10.150 MHz 10-kHz Total
40 meters 7.100- 7.105 MHz   5-kHz Total
80 meters 3.620- 3.635 MHz 15-kHz Total

Without yet having applied "good amateur practice" as of this writing,
all I can do is suggest some home frequencies to park-on and listen-to,

prior to establishing BEACONet activity:

12 meters: 24.924 USB + 1500 hz audio
15 meters: 21.089 USB + 1500 hz audio
17 meters: 18.104 USB + 1500 hz audio
20 meters: 14.094 USB + 1500 hz audio
30 meters: 10.139 USB + 1500 hz audio
40 meters: 7.099 USB + 1500 hz audio
80 meters: 3.619 USB + 1500 hz audio

The good news is that these frequencies:
o all fit within the sub-band because of using USB + 1500 hz Audio
o are all available to General class licensees and above

Please...don't forget that I'm not "planting a flag" on these
frequencies, I'm simply offering a starting place to do some listening,
before embarking on BEACONet operation on these bands.

Food for thought...
Ev, W2EV

         Then, on the other hand, you have the following, which I
occasionally get from Bob:

At 05:15 PM 12/2/2001 -0700, Bob Bruninga wrote:
>This message uses a character set that is not supported by the Internet

>character set.
         Plus an attachment named the same as the subject of the email.

Rendered body type: text/plain

Ed and the group,

I noticed what must be the new interference you described here too. It
appeared as a uniformly fuzzy area starting fairly sharply a little above
the 1500 Hz point, and continuing nearly uniformly up to the top of the
audio passband. It sounded like "fuzz", and was not strong enough to
interfere with beaconet reception. To me, it did not seem to have
individual strong "lines" like my usual monitor interference does.

The interesting thing is that it stopped suddenly. I normally have audio
enabled, and was sitting in front of the computer when it stopped. I wish
I had noted the time. Out here, near the coast, we hear junk all over the
VHF bands all the time, and usually blame it on the Navy.

Dave

NTP (Network Time Protocol), not NNTP (Network News Transport Protocol, the
protocol used for Usenet News).

There is also a time tool that comes with UIView, I scheduled it to run in
the periods that I *know* that I am on line, at least once a day. Keeps your
clock pretty much in sync, good enough to run Meteor Mode...

MAPI via Outlook Express. As you can see, it causes me a lot of trouble as
Outlook has a tendency to hang up if the dialup connection cannot be
established right away...

The v.1.73 emails that I send every 2 hours (mostly to myself, so you won't
see them on the list unless I forward it to the group) use SMTP. No problems
there at all. If the dialup connection fails there, v 1.73 "hangs" itself
until I manually dismiss the dialup box or connect to the internet when I
